sbfte@sbfte.org.br

Welcome Letter

Dear fellow SBFTE Members, Colleagues, and Friends,

I welcome you to the 55th Brazilian Congress of Pharmacology and Experimental Therapeutics, which has been organised by the Brazilian Society of Pharmacology and Experimental Therapeutics (SBFTE) since 1968. Our Society has held annual events where pharmacology and experimental therapeutics come together on diverse topics, high scientific standards, and international coverage.

The Scientific Organizing Committee, headed by Professor Emiliano Barreto, has worked hard to provide inspiring and thought-stimulating keynote presentations and symposiums exploring the latest advances in pharmacology research and education, attached with new therapeutic perspectives. *Exploring New Technologies in Pharmacology and Therapeutics* is the theme chosen for this meeting, a sensitive subject covering a substantial part of the scientific program. The Congress will assemble national and international leaders at the frontier of pharmacological and biomedical knowledge, addressing the most recent advances and progress in critical areas of pharmacology, such as inflammation and pain, cardiovascular pharmacology, neuropharmacology, and natural products. Three courses, nine lectures, eleven symposia, thirteen oral communication and two poster sessions will address educational, scientific dissemination and the popularisation of pharmacology, encouraging the maximum possible formal and informal interaction among all participants.

A highlight of the scientific program is the José Ribeiro do Valle (JRV) Award Symposium, a fantastic opportunity to congratulate the five young pharmacologists selected for the Award 2023. This timely initiative reaches 25 years of motivating post-graduate students to develop the skills necessary for a fruitful pharmacological career. Other activities of the 55th Brazilian Congress of Pharmacology that I would like to underline are the homages and presentations of the award winners of the first edition of the Women in Pharmacology in Brazil Award and the fourth edition of the Senior Pharmacologist Award. Congratulations to Professors Regina Pekelmann Markus, Regina de Sordi and Bernardo Boris Vargaftig, respectively, for their achievements. Finally, with the support of Elsevier, three abstracts submitted to the SBFTE 2023 Congress were selected by a committee of experts for the Pharmacological Research - Elsevier Award. I am already looking forward to announcing the winners of this award in our closing ceremony, along with the poster session highlights.

There are many people I would like to acknowledge for their support in bringing this annual meeting to life. The Congress committed many collaborators who helped either to set up the scientific program or rigorously refereeing the abstract submitted to the poster sessions. Many thanks to our invited speakers, session chairs, and those involved in our homage actions.

A special acknowledgement to the members of SBFTE 2023 Award Committees. The José Ribeiro do Valle Award Committee, composed of Professors Maria Martha Campos (PUC-RS, Coordinator), Ralf Jockers (Institut Cochin-CNRS, France, and Walter Koch (Temple University School of Medicine, USA). The Senior Pharmacologist Award Committee, composed of Professors Glaucius Oliva (University of São Paulo, Coordinator), Francesca Levi-Shaffer (The Hebrew University of Jerusalem, Israel), and Michel Nussenzweig (The Rockefeller University, USA). The Women in Pharmacology in Brazil Award Committee, composed of Professor Patricia Rieken Macedo Rocco (Federal University of Rio de Janeiro, Coordinator), Marzia Malcangio (King's College, London, UK) and Fernando de Queiroz Cunha (University of São Paulo, Ribeirão Preto). Their commitment and exemption were essential to select the awardees among the excellent candidates.

I thank our partners Biolab, Aché and Eurofarma for supporting the José Ribeiro do Valle Award, Senior Pharmacologist Award and Women in Pharmacology in Brazil Award, respectively. I also thank our sponsors, Alesco, Instituto de Ciências Farmacêuticas (ICF)/Simulation Plus, Oswaldo Cruz Foundation (Fiocruz), Itaipu Binacional, Elsevier, the National Council for Scientific and Technological Development (CNPq/Brazil), Coordination for the Improvement of Higher Education Personnel (CAPES/Brazil), and Foundation for Research Support of the State of São Paulo (FAPESP) for their financial support.

Finally, my special thank you to my colleagues and friends of the SBFTE Directory Board, Professors Teresa Dalla Costa, Flavia Santos, Richardt Gama Landgraf and Thiago Cunha, to the Young SBFTE Committee, headed by Professor Janylle Ferro, to Sandra H. R Cruz (SBFTE Executive Secretary), as well as to the SBFTE Communication team and Nui Eventos for their crucial contributions to this event.

The SBFTE 2023 Congress will be the first held in person since the Covid-19 pandemic. Thus, there are many celebrations and an excellent opportunity to catch up with friends and share our most recent scientific achievements. I wish you a stimulating and productive experience at the 55th Brazilian Congress of Pharmacology and Experimental Therapeutics in Foz do Iguacu.

Marco Aurélio Martins
President of SBFTE

President: Maurício Rocha e Silva

Vice-President: José Ribeiro do Valle

General Secretary: Alexandre P. Corrado

First Secretary: Lauro Sollero

Treasurer: Hanna A. Rothschild

About SBFTE Jovem

SBFTE Jovem is a committee formed by young pharmacologists' members of the Brazilian Society of Pharmacology and Experimental Therapeutics (SBFTE), founded in 2013.

We work in association with the SBFTE board of directors with the mission of creating a permanent political-scientific forum dedicated to undergraduate and graduate students, postdoctoral fellows, as well as young researchers and junior faculty.

Our goal is to discuss pharmacology-related scientific topics in order to promote early-career researchers' development and encourage our member's participation, insertion, and collaboration in SBFTE activities.

This year, SBFTE Young Committee is celebrating 10 years of work and progress and will coordinate crucial activities during the 55th Brazilian Congress of Pharmacology and Experimental Therapeutics in Foz do Iguaçu: 1) Beyond the Academy Round Table, 2) Meet the Professor luncheon, and 3) scientific dissemination to local school students. Beyond the Academy Round Table is proposed as an open discussion about innovation, new science challenges, how to engage in industry/pharmaceutical companies, or any other relevant opportunities beyond academic careers for early career scientists, scheduled to take place on September 26th, 2023 from 1:30 pm to 3:30 pm. Meet the Professor luncheon is proposed as a safe space for undergraduate and graduate students to interact with established professors about career challenges, project ideas, scientific issues, and experiences to be shared; with the aim of encouraging early career scientists to pursue their goals. This event is scheduled to take place on September 27th, 2023, from 12:20 pm to 1:20 pm (BRT). Scientific dissemination to local school students is a project in which we bring science and information to local high-school students with educational materials and accessible language, one day before the conference starts. Also, the students have the opportunity to visit our stand and poster session during the conference, to experience the world of scientists and to whiteness how we exchange our knowledge, scheduled to take place on September 27th, 2023 from 9:00 am to 11:30 am and 2:00 to 5:00 pm.

Last but not least, the third edition of SBFTE Jovem Cultural Contest for Scientific Dissemination is a contribution of this committee to science popularization, in which we encourage students to produce pharmacology-related informative videos using audiovisual resources, lays terms, metaphors, and creativity. Videos were initially analyzed by pharmacology professors and specialists, then elected by popular vote on social networks. The winners will be announced at the Closing Session of the 2023 conference. Finally, we invite the young pharmacologists to visit our stand this year as we are launching an activity to hear from you, what are your expectations, doubts, plans, and prospects!

Useful Information

Secretariat

Congress Secretariat will be open from 8:00 am to 6:00 pm

Lunch

The Congress offers a complimentary lunch on September 26th and 27th. Tickets are available inside the Participant's bag.

Posters

- All posters should be on display during the whole duration of the respective Poster Session. Posters should be taken off in the end of the Session. Check below for schedule.
- Poster presenters must attend the Session scheduled by the Scientific Committee (**Poster Session 1:** Sep 26th, from 5:10 pm to 7:10 pm. **Poster Session 2:** Sep 28th, from 10:00 am to 12:00 pm), when posters will be viewed by the Poster Evaluators.
 - **Poster Session 1:** You should fix your poster at the time you arrive at the Convention Center on Sep 26th and take it off at the end of the session on Sep 26th (7:10 pm).
 - **Poster Session 2:** You should fix your poster in the morning of Sep 27th (before the beginning of the session) and take it off at the end of the Session on Sep 27th (12:00 pm).

Certificates

The Certificates will be available online in the system (<https://www.nuieventos.com.br/sbft/>) until 10 days after the end of the Congress. You can download it in PDF in the Certificates area.

Courses

The course certificate will be given for the participants with at least 2 classes attendance.

Media Desk

Media desk will be open from 8:00 am to 6:00 pm. All speakers are requested to leave the material at Media Desk at least two hours before presentations. All rooms have *data show*. If you need any other equipment, please inform Media Desk as soon as possible. Lecturers presenting talks at 8:00 am should leave their material at the Media Desk the day before the presentation.

Badges

The use of badge is mandatory for all activities and circulation areas in the Convention Center.

Abstracts

Abstracts presented at the Poster Sessions will be available at SBFTE website (<https://sbfte.org.br/congressos-anteriores>).

Keynote Speakers

Bernardo Boris Vargaftig

Prof. Bernardo Boris Vargaftig was born in Argentina and with Brazilian citizenship, Bernardo Boris Vargaftig graduated in Medicine from the University of São Paulo (1958-1963). In 1964, like several other prominent Brazilian scientists, Vargaftig suffered fierce political persecution during the military dictatorship, having been arrested for more than 50 days by the government's political police. Faced with challenging circumstances, and with his nomination as Assistant Professor at the Faculty of Medical Sciences of Campinas being rejected, he left for France at the end of 1964 to build an international scientific trajectory of exceptional success in the field of Pharmacology. He made notable and fundamental contributions to several domains of knowledge in Pharmacology and Experimental Therapeutics, including the pioneering studies on NSAIDs showing their effects on arachidonic acid and SRS-C that helped to better understand the role of prostanoids in inflammation; studies on PAF that clarified the role of this mediator in inflammation and especially in allergy; investigations into the mechanisms of allergic and non-allergic lung inflammation and the protective role of estrogens. In France, Vargaftig was quickly hired by the Dutch pharmaceutical company Organon, where he directed research in pharmacology at the French branch for more than a decade, having also participated in research programs in partnership with the Dutch and Scottish branches, developing anti-inflammatory potentials and innovating in understanding its mode of action, especially with regard to the pharmacological role of lipid mediators. He presented the work as a Thesis to obtain the degree of Docteur d'État, in 1972, with the respected biochemist Prof. Huber Clauser. This was the main focus of his study interest throughout his professional life. His trajectory included prominent positions in institutions such as the Center International de Recherches Merrell, in Strasbourg, and the Institut Pasteur in Paris, where he led pioneering research on snake venoms and phospholipids, such as the Platelet Activating Factor. Still in Strasbourg, he led a team of four technicians and a PhD at Merrell, the latter Michel Chignard, who together with the Senior Technician, Jean Lefort, were at Vargaftig's side, in a journey of more than 40 years of fraternal and fruitful partnership during your stay in France. Over the 25 years at the Pasteur Institute, numerous Brazilian researchers, including graduate students, post-doctors and established researchers, were received at the Laboratoire de Pharmacologie Cellulaire for different periods of time, such as Renato Cordeiro, Momtchilo Russo, Patrícia M.R. e Silva, Marco Aurélio Martins, Alex Keller, Poseidon da Silva, Clystenes Silva, L. G. Carmo, Manassés Fonteles, Pedro Elsas and Maria Inês Elsas, among many others. At the Institut Pasteur, in addition to successful investigations in line with the past, he expanded and strengthened cooperation with Brazilian scientists, mainly with USP, IOC-Fiocruz and UFRJ. In 1992, Vargaftig was named Doctor Honoris Causa at Unicamp. His strong conviction in the importance of public recognition of research led him to organize a large number of highly successful scientific meetings, with international speakers, many of them under the banner of the Institut Pasteur EuroConferences, São Paulo Research Conferences in 2007, and the International Congress de Inflamação in Natal, 2013. Before that, with Renato Cordeiro and other collaborators, he also organized international scientific events of great impact in Rio de Janeiro. In 1986, with Otto Gotlieb and Renato Cordeiro, he organized the successful Colloque Franco-Bresilian sur la Chimie et la Pharmacologie des Substances Naturelles en Inflammation, Allergie et Thrombose. In 1992, with Renato Cordeiro and Stephen Prescott, he organized the Lipid Mediator and Cytokine Interactions in Inflammation, a satellite event of the 4th International Congress on Platelet Activating Factor and Related Lipid Mediators, in addition to other international meetings under the PAF Club brand held with Renato Cordeiro and Pierre Braquet at Fiocruz. At the age of 65, he retired from the Institut Pasteur, returning to Brazil and to USP in 2005. In the Department of Pharmacology at the Institute of Biomedical Sciences, he joined the team of Prof. Wothan Tavares de Lima to study the mechanisms of pulmonary inflammation triggered by intestinal lesions.

Francesca Levi-Schaffer

Francesca Levi-Schaffer is a Professor at The Hebrew University of Jerusalem in the Faculty of Medicine. She holds the Isaac and Myrna Kaye Chair in Immunopharmacology. Prof. Levi-Schaffer completed her PharmD degree at the University of Milano, her PhD in Immunology at the Weizmann Institute, Israel, and her post-doctorate at Harvard Medical School. She has published 184 articles in peer-reviewed journals, 106 reviews and editorials and 27 book chapters and has three patents and three provisional patents. She is President-Elect of the International Union of Basic and Clinical Pharmacology (IUPHAR) (2022-2024) and chairperson of the National Committee of IUPHAR representing the Israel Academy of Sciences and Humanities. She was instrumental in the establishment of an Immunopharmacology Section in the IUPHAR and served as its first Chair. She is a member of the Israeli Ministry of Health Committee for Human Experimentation of New Drugs; Editorial Board of the *Journal of Allergy and Clinical Immunology* (2019-2024); President of European Mast Cell and Basophil Research Network (2019-2024); Associate Editor of *Pharmacological Reviews* (2022-2025); and Associate Editor of *Annals of Allergy, Asthma & Immunology*. Her expertise is in the area of immunopharmacology of allergy focusing on mast cells and eosinophils, their activating and inhibitory receptors, their cross-talk for a better prophylaxis/treatment of allergic diseases. Moreover, her lab studies the role of mast cells and eosinophils in hypoxia (allergy, COPD); mastocytosis and its treatment; the crosstalk between atopic dermatitis and asthma with the microbiome. She is also developing novel monoclonal antibodies and bispecific antibodies against activating and inhibiting receptors on mast cells and eosinophils for the treatment of allergy and of selected solid tumors

José Ribeiro do Valle Award

José Ribeiro do Valle Award – First Place Winner History

	1998: Maria Martha Campos (UFSC; Adviser: João Batista Calixto)
	1999: José Eduardo da Silva Santos (UFSC; Adviser: Jamil Assreuy)
	2000: Ana Paula V. Dantas (USP-SP; Adviser: Maria Helena Catelli de Carvalho)
	2001: Liliam Fernandes (USP-SP; Adviser: Maria Helena Catelli de Carvalho)
	2002: Isaias Gleizer (USP-SP; Adviser: Cristoforo Scavone)
	2003: Juliano Ferreira (UFSC; Adviser: João Batista Calixto)
	2004: João Alfredo de Moraes (UERJ; Adviser: Thereza Christina Barja-Fidalgo)
	2005: Tiago Chiavegatti (Unifesp-EPM; Adviser: Rosely O. Godinho)
	2006: Ana Letícia G. Cabral Maragno (USP-RP; Adviser: Marcelo Damário Gomes)
	2007: Maria Fernanda de Paula Werner (UFSC; Adviser: Giles A. Rae)
	2008: Ana Luiza Andrade de Paula Lopes (Unifesp-EPM; Adviser: Rosely O. Godinho)
	2009: Silvio Manfredo Vieira (USP-RP; Adviser: Fernando de Q. Cunha)
	2010: Vanessa Olzon Zambelli (Instituto Butantan; Adviser: Yara Cury)
	2011: Tatiana Paula Teixeira Ferreira (Fiocruz; Adviser: Patrícia Machado Rodrigues e Silva)
	2012: Maíra Assunção Bicca (UFSC; Adviser: João Batista Calixto)
	2013: Jaqueline Raymondi Silva (USP-RP; Adviser: Fernando de Q. Cunha)
	2014: Jhimmy Talbot (USP-RP; Adviser: Fernando de Q. Cunha)
	2015: Daniele Maria Ferreira (UFPR; Adviser: Maria Fernanda de Paula Werner)
	2016: Gabriela S Kinker (USP, Adviser: Pedro Augusto Carlos Magno Fernandes)
	2017: Fernando Olinto Carreño (UFRGS, Adviser: Teresa C. Dalla Costa)
	2018: Bruna da Silva Soley (UFPR, Adviser: Daniela de Almeida Cabrini)
	2019: Douglas da Silva Prado (USP-RP) Adviser: José Carlos Alves Filho
	2021: Rianne Remus Pulcinelli (UFRGS) Adviser: Rosane Gomez
	2022 Fabio Bonifacio de Andrade (USP-RP) Adviser: Thiago M. Cunha

José Ribeiro do Valle Award – 2023 Finalists

	Nathália Ferreira de Oliveira BSc in Pharmacy (UFRJ) (2011-2017) PhD in Biological Sciences (Pharmacology and Medicinal Chemistry) (UFRJ) Adviser: Claudia Lucia Martins Silva
	Bruna Felipe Ferreira BSc in Biomedical Sciences (USP-RP) (2017-2021) MSc in Pharmacology (USP-RP) Adviser: Sabrina Francesca de Souza Lisboa
	Jorge Luiz Dallazen BSc in Pharmacy (UFPR) (2012-2016) MSc in Pharmacology (UFPR) (2017-2019) PhD in Pharmacology Adviser: Soraia Katia Pereira Costa
	Gabriela Gomes Ferreira BSc in Biomedicine (UVA) (2016-2020) MSc in Biosciences (UERJ) (2020-2023) PhD in Pharmacology (Fiocruz) Adviser: Patrícia Machado Rodrigues e Silva Martins
	Bianca de Sousa Leal BSc in Pharmacy (UNIFSA) (2014-2019) MSc in Pharmacology (UFPI) Adviser: Dalton Dittz Junior

Scientific Program

Sep. 25, 2023 (Monday)

8:00 am	Venue Secretariat
7:00 am-12:00 pm	SBFTE e Divulgação de Farmacologia na Escola Pública (Promoting Pharmacology in Primary Public Schools in Foz do Iguaçu) Colégio Estadual Jorge Schimmelpfeng (EFMP) (Turmas: 1º Ano Técnico em Farmácia, 2º e 3º Anos do Ensino Médio) Chairs: Marco Aurélio Martins (President SBFTE) / SBFTE Young Committee
9:00 am-12:00 pm	Pre-Congress Course
Fortaleza I Room	Learning the Discovery and Development Process of New Drugs and Medicines with the Screener Educational Game (Aprendendo o Processo de Descoberta e Desenvolvimento de novos Fármacos e Medicamentos com o Jogo Educacional Screener) Chair: François G. Noel (UFRJ)
9:00 am-12:00 pm Foz do Iguaçu Room	Meeting of the Board of SBFTE Directors and Deliberative Council (Council and Directory Board Members only)
12:00-1:00 pm	Lunch
1:00-3:00 pm Fortaleza II Room	Meeting of SBFTE Permanent Forum of Graduate Courses in Pharmacology
1:00-5:00 pm	Pre-Congress Course
Fortaleza I Room	Learning the Discovery and Development Process of New Drugs and Medicines with the Screener Educational Game (Aprendendo o Processo de Descoberta e Desenvolvimento de novos Fármacos e Medicamentos com o Jogo Educacional Screener) Chair: François G. Noel (UFRJ)
3:00-3:20 pm	Coffee Break
3:20-4:30 pm	Lecture
Fortaleza II Room	Insights at Postgraduate Evaluation in the area of Biological Sciences II (Um olhar na Avaliação da Pós-Graduação na área das Ciências Biológicas II) Leticia Veras Costa Lotufo (USP-SP, Coordenadora de Área Ciências Biológicas II – Capes) Chair: Carolina Demarchi Munhoz (USP-SP, Coordinator Permanent Forum of Graduate Courses in Pharmacology)
Águas de Lindóia Room	
7:00-7:30 pm	Opening Session
7:30-8:30 pm	Opening Lecture
<i>Sergio Ferreira Lecture</i> L1 – A monument to Aspirin Bernardo Boris Vargaftig (USP-SP) SBFTE / Aché Fourth Senior Pharmacologist Award	
8:30-10:30 pm	Cocktail

Sep 26, 2023 (Tuesday)

8:00-8:50 am | Courses

Águas de Lindóia Room	<p>Cr1 – Animal Models and their New Technologies for Neuroscience Studies (Modelos Animais e suas Novas Tecnologias para Estudos em Neurociência) Chair: Cristiane Flora Villareal (UFBA)</p> <ul style="list-style-type: none">◆ Class 1: Exploring Stem Cells in Modeling Neurogenetic Diseases (Explorando Células-Tronco na Modelagem de Doenças Neurogenéticas) Jacqueline Alves Leite (UFG)
Fortaleza Room	<p>Cr2 – Adrenal Gland Steroids in Health and Disease (Esteroides da Glândula Adrenal na Saúde e na Doença) Chair: Maria Christina W. Avellar (Unifesp-EPM)</p> <ul style="list-style-type: none">◆ Class 1: <i>Classical and recent concepts of adrenal steroidogenesis - focus on androgenic steroids, mechanism of action and function</i> (Conceitos clássicos e recentes da esteroidogênese na adrenal - foco em esteroides androgênicos, mecanismo de ação e função) Maria Christina W. Avellar (Unifesp-EPM)
Ribeirão Preto Room	<p>Cr3 – Playfulness in the Classroom: a Case of Gamification for Teaching Pharmacology (O Império do Lúdico na Sala de Aula: um Case de Gamificação para o Ensino da Farmacologia) Chair: Francislaine Aparecida dos Reis Lívero (UFPR)</p> <ul style="list-style-type: none">◆ Class 1: <i>New educational scenario: what does the teacher need to learn? (Novo cenário educacional: o que o professor precisa (des)aprender?)</i> Francislaine Aparecida dos Reis Lívero (UFPR)

9:00-9:50 am | Lectures

Águas de Lindóia Room	<p>L2 – Interpretable Machine Learning Approaches for Drug Repurposing and Side Effect Prediction Alberto Paccanaro (FGV) Presented by Jamil Assreuy (UFSC)</p>
Ribeirão Preto Room	<p>L3 – Neuroimmune Interactions and Arthritis Pain in Neurodegenerative Conditions Marzia Malcangio (King's College London, UK) Presented by: Thiago M. Mattar (USP-RP)</p>

9:50-10:10 am | Coffee-break

10:10 am-12:10 pm | Symposia/Oral Communication

Águas de Lindóia Room	<p>S1 – Novel Endothelial-Derived Catecholamines Chair: Gilberto De Nucci (Unicamp)</p> <ul style="list-style-type: none">◆ <i>Identification and pharmacology of novel endothelial-derived catecholamines</i> Gilberto De Nucci (Unicamp)◆ <i>Synthesis, pKa determination and redox properties of catecholamine derivatives</i> Larryn Peterson (Rhodes College, USA)◆ <i>Synthesis and chiral resolution of 4-nitro and 7-nitropropranolol and preparation of other nitrated or halogenated dopamine congeners</i> Francesco Frecentese (University of Naples Federico II, Italy)
-----------------------	--

	<ul style="list-style-type: none"> ◆ <i>Production/release of 6-nitrodopamine by human umbilical cord artery in vitro: NO oxidative clues?</i> Marcelo N. Muscará (USP-SP)
Fortaleza Room	<p>S2 – Energy Transfer-Based Technologies (BRET, HTRF) to Characterize Receptor Function Chair: Erika Cecon (Institut Cochin-CNRS, France)</p> <ul style="list-style-type: none"> ◆ <i>Energy Transfer-Based Technologies (BRET, HTRF) to identify new therapeutic targets</i> Erika Cecon (Institut Cochin-CNRS, France) ◆ <i>Pharmacological profiling of GPCR variants in metabolic diseases</i> Ralf Jockers (Institut Cochin-CNRS, France) ◆ <i>Investigating the Physiology of putative malarial 7-transmembrane proteins in HEK293 Cells</i> Célia Regina da Silva Garcia (USP-SP) ◆ Oral Communication 1: 01.006 <i>The influence of adenosine receptor antagonism on PDE4 and PDE8 Inhibitors induced airway smooth muscle relaxation.</i> Satori NA, Pacini ESA, Godinho RO. Unifesp-EPM, Div. Cellular Pharmacology, Dept of Pharmacology, São Paulo, SP, Brazil ◆ Oral Communication 2: 05.017 <i>The antinociceptive effect of cannabinoid receptor agonists is enhanced in aspirin-triggered Lipoxin A4 treated-diabetic rats.</i> Ferreira MV¹, Jesus CHA², Bonfim JC¹, Oliveira G¹, Liebl B¹, Verri-Junior WA³, Zaneli JM¹, Cunha JM¹. ¹UFPR, Dept of Pharmacology, Curitiba, PR, Brazil; ²Indiana Univ. Bloomington, Dept of Psychological and Brain Sciences, USA; ³UEL, Dept of Pathology, Londrina, Brazil.
Ribeirão Preto Room	<p>S3 – Novel Technologies Fostering Innovative Drug Discovery Chair: Daniela Barretto Barbosa Trivella (CNPEM)</p> <ul style="list-style-type: none"> ◆ <i>Putting the dynamics into compound profiling: using kinetic assays to shape early stage drug discovery</i> Nicholas D. Holliday (University of Nottingham, UK) ◆ <i>Targeting key relevant cancer proteins with marine natural products</i> Leticia Veras Costa-Lotufo (USP-SP) ◆ <i>Natural product drug discovery at LNBIO-CNPEM</i> Daniela Barretto Barbosa Trivella (CNPEM) ◆ <i>Preclinical development of MB 905, a RNA polymerase inhibitor capable of inhibiting SARS-CoV-2 replication and lung inflammation</i> João Batista Calixto (CIEnP)
12:10-1:20 pm	Lunch
12:10-1:20 pm	
Águas de Lindóia Room	Meeting of the North-Northeast and Central West Region Pharmacology Network (with Lunch Box)
Ribeirão Preto Room	SBFTE Young Assembly (with Lunch Box)
1:30-3:30 pm	Symposia/Roundtable
Águas de Lindóia Room	<p>S4 – Vascular Networks: The Vasculature as a Pathogenic Highway Chair: Claudia Lucia Martins Silva (UFRJ) / Suellen D. Oliveira (University of Illinois Chicago, USA)</p>

	<ul style="list-style-type: none"> ◆ <i>Cardiopulmonary pathogenic networks: Schisto-PAH and the lung microbiome</i> Suellen D. Oliveira (University of Illinois Chicago, USA) ◆ <i>Vascular Networks: The vasculature as a pathogenic highway</i> Rita C. Tostes (USP-RP) ◆ Oral Communication 1: 06.008 <i>Cecal slurry as a research model for new pharmacological therapies for sepsis-induced cardiovascular dysfunction.</i> Delfrate G, Assreuy J, Fernandes D. UFSC Florianópolis, Dpt of Pharmacology, Brazil. ◆ Oral Communication 2: 02.029 <i>Gestational sepsis induces neurovascular alteration and oxidative stress in the frontal cortex and hippocampus of neonatal mice.</i> Granja MG^{1,3}, Alves LP^{2,3}, Moraes FM^{1,3}, Santos APA³, Siqueira MFR³, Estato V³, Silva AR³, Gonçalves-de-Albuquerque CF^{1,3}, Castro-Faria-Neto HC^{1,2,3} ¹Unirio, PPG Biologia Molecular e Celular, Brazil; ²UFRJ, PPG Imunologia e Inflamação, Brazil; ³Fiocruz, Lab of Imunofarmacologia, Brazil

Ribeirão Preto Room	<p>S11 – Cardio Steroids and α-Na,K-ATPase Isoforms in Neurological Disorders: New Insights</p> <p>Chair: Luis Eduardo Menezes Quintas (UFRJ)</p> <ul style="list-style-type: none"> ◆ <i>Role of endogenous ouabain and Na,K-ATPase α-isoforms in the etiology of bipolar disorder.</i> <p>Rif S. El-Mallakh (University of Louisville School of Medicine, USA)</p> <ul style="list-style-type: none"> ◆ <i>Dental pulp-derived mesenchymal stem cells for modeling neurogenetic disorders associated with Na,K-ATPase</i> <p>Jacqueline Alves Leite (UFG)</p> <ul style="list-style-type: none"> ◆ <i>New pharmacological therapy for Childhood Alternating Hemiplegia (AHC): evaluation of BD-15 and development of new drugs</i> <p>Leandro Augusto de Oliveira Barbosa (UFSJ)</p>
6:00-7:30 pm	
Águas de Lindóia Room	SBFTE Assembly

Sep 28, 2023 (Thursday)

8:00-8:50 am | Courses

Águas de Lindóia Room	<p>Cr1 – Animal Models and their New Technologies for Neuroscience Studies (Modelos Animais e suas Novas Tecnologias para Estudos em Neurociência) Chair: Cristiane Flora Villareal (UFBA)</p> <p>♦ Class 3: <i>Experimental models of pain and nociception: new approaches in the study of pain in rodents and humans (Modelos experimentais de dor e nocicepção: novas abordagens nos estudos da dor em roedores e em humanos)</i> Cristiane Flora Villareal (UFBA)</p>
Fortaleza Room	<p>Cr2 – Adrenal Gland Steroids in Health and Disease (Esteroides da Glândula Adrenal na Saúde e na Doença) Chair: Maria Christina W. Avellar (Unifesp-EPM)</p> <p>♦ Class 3: <i>Clinical disorders associated with adrenal steroid biosynthesis and function and therapeutic approaches (Distúrbios clínicos associados a biosíntese e função de esteroides adrenais e abordagens terapêuticas)</i> Maria Christina W. Avellar (Unifesp-EPM) / Vinicius de Farias Carvalho (Fiocruz)</p>
Ribeirão Preto Room	<p>Cr3 – Playfulness in the Classroom: a Case of Gamification for Teaching Pharmacology (O Império do Lúdico na Sala de Aula: um Case de Gamificação para o Ensino da Farmacologia) Chair: Francislaine Aparecida dos Reis Lívero (UFPR)</p> <p>♦ Class 3: <i>Transforming the classroom: presentation of a case of gamified pharmacology classes (Transformando a sala de aula: apresentação de um case de aulas gamificadas de farmacologia)</i> Francislaine Aparecida dos Reis Lívero (UFPR)</p>

9:00-9:50 am | Lectures

Águas de Lindóia Room	<p>L6 – Cardiac Fibroblast: in the Heart of Cardiac Inflammation Guillermo Díaz Araya (University of Chile, President Chilean Society of Pharmacology, Chile) Presented by Rita C. Tostes (USP-RP)</p>
Ribeirão Preto Room	<p>L7 – Resolution Pharmacology to Control the Morbidity of Chronic Diseases Mauro Perretti (Queen Mary University of London, UK) Presented by: Patrícia M. R. e Silva Martins (Fiocruz)</p>

10:00 am -12:00 pm | Poster Session 2 with Coffee brunch

Maceió Room	<p>01 Cellular and Molecular Pharmacology (01.010 a 01.014) 02 Neuropharmacology (02.011; 02.032 a 02.047) 03 Psychopharmacology (03.020 a 03.027) 04. Inflammation and Immunopharmacology (04.036 a 04.056) 05. Pain and Nociception Pharmacology (05.017 a 05.022) 06. Cardiovascular and Renal Pharmacology (06.021 a 06.025; 06.027 a 06.037) 07. Endocrine, Reproductive and Urinary Pharmacology (07.009) 08. Respiratory and Gastrointestinal Pharmacology (08.009 a 08.012; 08.014; 08.016 a 08.017) 09. Natural Products and Toxinology (09.026 a 19.030; 09.032; 09.034 a 09.037; 09.040 a 09.047) 10. Cancer Pharmacology (10.008 a 10.014)</p>
-------------	---

	<p>11. Clinical Pharmacology, Pharmacokinetics, Pharmacogenomics and Toxicology (11.015 a 11.026)</p> <p>12. Drug Discovery and Development (12.018 a 12.023)</p> <p>14. Pharmacology: Other (14.006 a 14.015)</p>
12:15-1:05 pm	Closing Lecture
Águas de Lindóia Room	<p>L8 - The Allergic Effector Unit and the Mast Cells as Masterminds from Inflammation to its Resolution. Have we found New Druggable Targets?</p> <p>Francesca Levi-Schaffer (The Hebrew University of Jerusalem, Israel, President-Elect IUPHAR)</p> <p>Presented by Marco Aurelio Martins (Fiocruz)</p>
1:15-1:45 pm	Closing Ceremony
Águas de Lindóia Room	José Ribeiro do Valle Award and Prize Announcements

Poster Session 1 – 26/08/2023

01. Cellular and Molecular Pharmacology

01.001 CDR1as Overexpression in MPP+ Injured SH-SY5Y Dopaminergic Cells. Ferrari SSAR, Silva LDS, Duarte CDM, Gomes GMO, Schlemmer F, Xavier ME, Titze-de-Almeida SS, Titze-de-Almeida R UnB, Brasília, Brasil

01.002 Does the P2Y12 Receptor Adjust the Daytime Pinealocytes Melatonin Levels? Santos UJ, Correa JC, Nekrasius LB, Markus RP, Sousa KS, Silva ZF. IB-USP, Dept of Physiology, São Paulo, SP, Brazil

01.003 Crosstalk between Endothelial Purinergic P2Y2/P2X7 Receptors Increases Leukocyte Adhesion favoring Mesenteric Inflammation during Schistosomiasis. Oliveira NF¹, Mainieri NS¹, Tamura AS², Coutinho-Silva R², Savio LEB², Silva CLM¹ ¹ICB-UFRJ, Brazil; ²ICBBF-UFRJ, Rio de Janeiro Brazil

01.004 Effects of Epigallocatechin-3-Gallate on Gluconeogenesis Key-Enzymes and on Mitochondria: Potential Mechanisms Underlying its Hypoglycemic Effects. Bonetti CI, Correia BL, Souza GH, Nakanishi ABS, Comar JF, Bracht L Lab. of Hepatic Metabolism. UEM, Maringá, PR, Brazil

01.005 Evaluation of the *in vitro* Antioxidant Effect of New Compounds LQFM348 and LQFM354 in the Human Neuronal SH-SY5Y Cell Line. Campos HM¹, Ferreira PYO¹, Pagliarani B², Menegatti, R³, Ghedini PC¹, Tarrozi A² ¹UFG, Dept of Pharmacology, ²University of Bologna, Dept for Life Quality Studies, ³UFG, Faculty of Pharmacy

01.006 The Influence of Adenosine Receptor Antagonism on PDE4 and PDE8 Inhibitors Induced Airway Smooth Muscle Relaxation. Satori NA, Pacini ESA, Godinho RO Unifesp-EPM, Div. Cellular Pharmacology, Dept of Pharmacology, São Paulo, SP, Brazil

01.007 The Gasotransmitter Hydrogen Sulfide (H₂S) Potentiates the *ex vivo* Secretion of α -Amylase Induced by Both Adrenergic and Cholinergic Agonists on Murine Salivary Glands. Oliveira-Alves MC, Almeida ARB, Teixeira SA, Costa SKP, Muscará MN. USP, Dpt of Pharmacology, Lab. of Biochemical Pharmacology of Free Radicals, Inflammation and Pain, Brazil

01.008 The Role of Alveolar Macrophages-Expressed Plet1 In Alveolar Repair After Viral Pneumonia. Pervizaj-Oruqaj L^{1,2,3}, Selvakumar B^{1,5,6}, Ferrero MR^{1,2,3,5,6}, Cohen M⁶, Fagundez C⁶, Heiner M^{1,2,3}, Malainou C^{1,2,3}, Glaser RD², Wilhelm J^{2,3,4}, Bartkuhn M², Weiss A^{3,4}, Alexopoulos I^{1,2,3}, Seeger W^{2,3,4,5,6}, Vazquez-Armendariz AI^{1,2,3}, Herold H^{1,2,3} ¹Universities of Giessen and Marburg Lung Center, Dept of Internal Medicine, German Center for Lung Research, Giessen, Germany. ²Justus Liebig University Giessen, Inst. for Lung Health, Giessen, Germany. ³Excellence Cluster Cardio-Pulmonary Institute. ⁴Universities of Giessen and Marburg Lung Center Dept of Internal Medicine, ⁵Max Planck Institute for Heart and Lung Research, Bad Nauheim, Germany, ⁶Instituto de Investigación en Biomedicina de Buenos Aires, Buenos Aires, Argentina

01.009 Activation of β -adrenoceptor-Adenylate Cyclase System Promotes cAMP Efflux via ABCC/MRP Transporters in Rat Vas Deferens, Prostate, Bladder and Aorta. Pacini ESA, Satori NA, and Godinho RO Unifesp-EPM, Div. Cellular Pharmacology, Dept of Pharmacology, São Paulo, SP, Brazil

02. Neuropharmacology

02.001 Effects of the Poloxamer P188 and the Dispersion P188 and Hydroalcoholic Extract of Propolis in Mice Submitted to Bilateral Occlusion of the Common Carotid Arteries. Candido G¹; Kohara NAN¹; dos Santos RS²; Bruschi ML²; Milani H¹; de Oliveira RMW¹. ¹UEM Maringá, Lab. of Pharmacology and Therapeutics, Brazil; ²UEM Maringá, Lab. of Research and Development of Drug Delivery Systems, Brazil

02.002 Autophagy and Brain Ischemia: Effects of Cannabidiol. Kohara NAN, Splendor MC, Chinen LY, Meyer E, Bonato JM, Oliveira RMMW, Milani H UEM, Lab. of Cerebral Ischemia and Neuroprotection, Maringá, PR, Brazil

02.003 Ferulic Acid-loaded Nanostructure Prevents Morphine Reinstatement: The Involvement of Dopamine System, NRF2 and δ fosb in the Striatum Brain Area of Wistar Rats. Fontoura MB¹, Milanese

LH¹, Rossato DR¹, Da Rosa JLO¹, Burger ME² ¹UFSM, Graduate Program in Pharmacology, Brazil, ²UFSM, Dept of Physiology and Pharmacology, Brazil

02.004 Diacylglycerol Kinase Inhibition Attenuates Endotoxic Fever by Regulating Prostaglandin E2 Production in Rat Hypothalamus. Assis DAS, Guimaraes NC, Gomes BRB, Sousa GLS, Teixeira DMT, Souza PEN, Veiga-Souza FH. UnB, DF, Brazil

02.005 *In silico* Drug Repurposing Identifies Potential Therapeutic Candidate for Bipolar Disorder Mood States. Mezzomo G^{1 2}, Rampelotto PH^{1 2}, Rosa PH^{1 2}, Schons T¹, Ziani PR^{1 2}, Rosa AR^{1 2 3}. ¹HCPA, Lab. of Molecular Psychiatry, Porto Alegre, Brazil; ²UFRGS, PPG in Biological Sciences: Pharmacology and Therapeutics, Instituto de Ciências Básicas da Saúde, ³Dept of Pharmacology, Instituto de Ciências Básicas da Saúde, UFRGS, Porto Alegre, Brazil

02.006 Immobilization and Social Isolation Stress in the Juvenile Phase Cause Different Effect in Anxious-Type Behavior in Adolescent Male and Female. Barilli LA¹; Dalben MB²; Pereira GH²; de Melo SR². ¹UEM PPG Pharmaceutical Sciences, Brazil, ²UEM, Dpt of Morphological Sciences, Brazil

02.007 Effect of Oubain on Marker Expression of Neural Progenitor Cells in Dental Pulp Stem Cells. Cunha JCL¹, Coelho LDS³, Farias ERA², Fonseca MFR², Neves EPF², Oliveira LC², Silva SS², Oliveira LLR³, Lima AP³, Valadares MC³, Leite JA². ¹UFG Goiânia PPG Biological Sciences, Dpt of Pharmacology, Brazil, ²UFG Goiânia, Dpt of Pharmacology, Brazil, ³UFG Goiânia, School of Pharmacy, Brazil

02.009 P-coumaric Acid Derivates from Brazilian Green Propolis Attenuate Behavioral Changes, Oxidative Stress and Barriers Damage in DSS-induced Colitis Model. Cazarin CA¹, Bauer ER¹, Valachinski AW¹, Longo B¹, Basílio MI¹, Machado MS¹, Silva TFQ¹, Cury BJ¹, Venzon L¹, França TCS¹, Santos AC¹, Nunes RKS¹, Bastos JK², da Silva LM¹, de Souza MM¹.¹Univali Itajaí, PPG Ciências Farmacêuticas, Brazil; ²USP, Faculdade de Ciências Farmacêuticas, Ribeirão Preto, Brazil

02.010 Effect of Taurine on GABA Levels in the Nucleus Accumbens of Rats Chronically Treated with Alcohol or Abstinence: A Microdialysis Study. Pulcinelli RR¹, Caletti G¹, SantAna BH¹, Nin MS², Izolan LR³, Oliveira TF⁴, Eller S⁴, Gomez R^{1,3}. ¹UFRGS, PPG Farmacologia e Terapêutica, Brazil; ²Universidade Factum, Porto Alegre, Brazil; ³UFRGS, PPG Neurociências, Porto Alegre, Brazil; ⁴UFCSPA, Porto Alegre, Dep Farmacociências, Brazil

02.012 Disintegration of the Blood-Brain Barrier in Male BCCAO Mice. Splendor MC, Humberto M, Oliveira RMMW. UEM, Dept of Pharmacology and Therapeutics, Maringá, PR, Brazil

02.013 Evaluation of TRPA1 Involvement in Oxidative and Inflammatory Processes Induced by Corticosterone in Microglial Cells (BV-2 cells). Brum GF¹; Fontana T², Pappis L³, Piton E¹; Machado AK⁴, Montagner TRS⁴; Machado AK²; Bochi GV¹ ¹UFSM Santa Maria, PPG Farmacologia, Brazil; ²UFN, Santa Maria, PPG Nanociências, Brazil; ³University of Toronto, Dpt of Pharmacology and Toxicology, Canada ⁴UFN Santa Maria, Curso de Biomedicina, Brazil

02.014 Pharmacologically-Enhanced Memory Destabilization allows the Impairing Effects of Reconsolidation Blockers in Male and Female Rats. Soares LA¹, Gazarini L², Bertoglio LJ¹ ¹Lab. of Neuropsychopharmacology, Dept of Pharmacology; UFSC, Florianópolis, SC, Brazil. ²UFMS, Três Lagoas, MS. Brazil

02.015 Physical Exercise Provides Beneficial Changes on Neurotrophic Factors in Brain Areas after AMPH Relapse. Rosa JLO¹, Rosa HZ¹, Segat HJ¹, Barcelos RCS¹, Roversi K¹, Rossato DR¹, Burger ME². ¹UFSM, PPG em Farmacologia, Santa Maria, RS, Brazil, ²UFSM, Depto de Fisiologia e Farmacologia, Santa Maria, RS, Brazil

02.016 The Effects of Chronic Treatment with Semaglutide on Cerebral Vascular Inflammation in Mice with Metabolic Syndrome. Chateaubriand PHP², Curty M², Lustosa R², Baroni M², Ritta JCS³, Costa M², Figueiredo V², Obadia N^{2,3} Castro-Faria-Neto HC¹, Estato V^{1,2}. ¹IOC-FIOCRUZ, Lab. de Imunofarmacologia, Rio de Janeiro, Brasil; ²Idomed-Unesa, Rio de Janeiro, Brasil; ³Unesa, Faculdade de Farmácia, Rio de Janeiro, Brasil

02.017 The Effects of GLP-1 Receptor Activation on Hippocampal Neuronal Integrity in Animals with Metabolic Syndrome. Curty M², Chateaubriand PHP², Lustosa R², Baroni M², Ritta JCS², Costa M²,

Figueiredo V², Castro-Faria-Neto HC¹, Obadia N³, Estado V^{1,2} ¹IOC-Fiocruz, Lab. de Imunofarmacologia, Rio de Janeiro, Brasil, ²Idomed-Unesa, Rio de Janeiro, Brasil. ³Unesa, Faculdade de Farmácia, Rio de Janeiro, Brasil

02.018 Investigating the Impact of Prebiotic Supplementation on Inflammation in the Cerebral Microcirculation of Animals with Metabolic Syndrome: Exploring with Intravital Microscopy. Baroni M², Curty M², Chateaubriand PHP², Lustosa R², Ritta JCS³, Costa M², Figueiredo V², Obadia N^{1,3}, Castro-Faria-Neto HC¹, Estado V^{1,2} ¹IOC-Fiocruz, Lab. de Imunofarmacologia, Rio de Janeiro, Brasil, ²Idomed-Unesa, Rio de Janeiro, Brasil. ³Unesa, Faculdade de Farmácia, Rio de Janeiro, Brasil

02.019 Intermittent Taurine Administration Increases Alcohol Consumption in Adolescent Male Rats Exposed to the Binge Drinking Model. SantAna BH, Zilli GAL, Bastiani CS, Pulcinelli RR, Izolan LR, Leal MB, Gomez R UFRGS

02.020 A Systematic Review of the Role of Thalamic Nucleus Reuniens in Memory Acquisition and Consolidation in Lab. Rodents. Batista LP¹, Soares LA¹, Panzenhagen AC², Bertoglio LJ¹ ¹UFSC ²UFRGS

02.021 Beta-caryophyllene Exerts Protective Effect after Pilocarpine Induced-Status Epilepticus. Bariviera JL, Mallmann MP, Oliveira MS UFSM, Dpt of Physiology and Pharmacology, Santa Maria, Brazil

02.022 Semaglutide Improves Capillary Density and Cerebral Microvascular Function in a Mouse Model of Metabolic Syndrome. Costa M², Lustosa R², Baroni M², Curty M², Chateaubriand PHP², Ritta JCS³, Figueiredo V², Obadia N³, Faria Neto HC¹, Estado V^{1,2} ¹IOC-Fiocruz, Lab. de Imunofarmacologia, Rio de Janeiro, Brasil, ²Idomed-Unesa, Rio de Janeiro, Brasil. ³Unesa, Faculdade de Farmácia, Rio de Janeiro, Brasil

02.023 Semaglutide Restores Astrocytic Coverage in Cerebral Capillaries of Animals with Diet-Induced Metabolic Syndrome. Lustosa R², Baroni M², Curty M², Chateaubriand PHP², Ritta JCS³, Costa M², Figueiredo V², Obadia N^{1,3}, Faria Neto HC¹, Estado V^{1,2} ¹IOC-Fiocruz, Lab. de Imunofarmacologia, Rio de Janeiro, Brasil, ²Unesa- Idomed, Rio de Janeiro, Brasil., ³Unesa, Faculdade de Farmácia Rio de Janeiro, Brasil.

02.024 Cannabidiol prevents amphetamine relapse in rats. Souza LEM¹, Rosa JLO², Metz VG², Burger ME³, Pase CS³. ¹UFSM, Centro de Ciências da Saúde, ²UFSM, PPG em Farmacologia, ³UFSM, Depto de Fisiologia e Farmacologia

02.025 Antipsychotic-Like Activity of Micronized Naringenin Particles Produced by Supercritical CO₂. Tavares VB¹, Oliveira PV², Sanaiotto O¹, Kuhn KZ¹, Daniel CF¹, Provinelli AC¹, Schio ACZ¹, Siebel AM³, Bortoluzzi A², Lanza M², Oliveira JV², Müller LG¹ ¹Unochapecó ²UFSC, UFSC ³FURG

02.026 Omega-3 (DHA) Downregulates Inflammatory State in Microglial Cell Line. Moraes-de-Souza I¹, Moraes BPT^{1,3}, Almeida MAP^{2,3}, Bozza PT², Castro-Faria-Neto HC², Silva AR^{2,3}, Gonçalves-de-Albuquerque CF^{1,2,3} ¹Unirio, Immunopharmacology Lab., Dpt of Physiological Sciences, Rio de Janeiro, Brazil; ²IOC-Fiocruz, Immunopharmacology Lab., Rio de Janeiro, Brazil; ³UFF, PPG Neuroscience, Niterói, Brazil

02.027 The γ -benzylidene digoxin derivative BD-15 reduces oxidative stress in the hippocampus and cortex induced by LPS Neves EPF¹, Fonseca MFR¹, Silva SS¹, Farias ERA¹, Ferreira PYO¹, Machado MV², Villar JAFP², Campos HM¹, Pereira RM¹, Ghedini PG¹, Barbosa LA², Leite JA¹ ¹UFG, Dept of Pharmacology, Institute of Biological Sciences, Goiânia, Brazil. ²UFSJ, Lab de Bioquímica Celular, São João Del Rei, Brazil

02.028 Alterations in Molecular Targets in Dopaminergic Areas of the Brain Induced by Cannabidiol in Rats Previously Exposed to Amphetamine. Rossato DR¹, Rosa JLO¹, Metz VG², Burger ME², Pase CS² ¹UFSM, PPG em Farmacologia, ²UFSM, Depto de Fisiologia e Farmacologia

02.029 Gestational Sepsis Induces Neurovascular Alteration and Oxidative Stress in The Frontal Cortex and Hippocampus of Neonatal Mice. Granja MG^{1,3}, Alves LP^{2,3}, Moraes FM^{1,3}, Santos APA³, Siqueira MFR³, Estado V³, Silva AR³, Gonçalves-de-Albuquerque CF^{1,3}, Castro-Faria-Neto HC^{1,2,3}

¹Unirio, PPG Biologia Molecular e Celular, Brazil; ²UFRJ, PPG Imunologia e Inflamação, Brazil; ³Fiocruz, Lab of Imunofarmacologia, Brazil

02.030 Eriodictyol Protects Mice with Streptozotocin-Induced Sporadic Alzheimer Disease: In Silico, in vitro and in vivo Study. Caracas P¹, Tavares J¹, Andrade LM², Albuquerque A², Silva JHM², Andrade GM¹. ¹UFC, Dpt Center for Research and Development of Medicines, Brazil; ²Fiocruz, Lab. of Structural and Functional Biology.

02.031 Effects of Low-Dose Cannabis Extract on Non-Motor Symptoms and Quality of Life in Parkinson's Disease Patients - Five Case Report. Pauli KB, Ruver-Martins AC, Silva T, Souza BL, Hollas VG, Silva EG, Nascimento FP. Unila, Lab. of Medicinal Cannabis and Psychedelic Science, Foz do Iguaçu, PR, Brazil

03. Psychopharmacology

03.001 Luteolin as a Promissory Flavonoid to Improve Neurobehavioral and Gastrointestinal Changes in Autism Spectrum Disorders: Experimental Findings in Rats. Longo B, Nunes RKS, Cazarin CA, Silva TFQ, Dos Santos AC, Venzon L, Da Silva LM, Pagliochi ACS, Sievers J, Pilati SFM, De Souza MM, Da Silva LM. Univali, Postgraduate in Pharmaceutical Sciences, SC, Brazil.

03.002 Potential Antidepressant-like Effect of *Centella asiatica* Extract and Active Compound Madecassic Acid in Animals Submitted to Material Deprivation and Social Isolation. Bertollo AG¹, Kreuz K¹, Medeiros J¹, Mingoti MED¹, Silva BV¹, Cassol JV¹, Dallagnol P¹, Narzetti RA¹, Roman Junior WA², Bohnen LC², Ignacio ZM¹. ¹UFFS; ²Unochapecó

03.003 Affinity of Antidepressants to dDAT: Is More Aromatic Rings Better? Triches FF¹, Triches F², Oliveira CL¹. ¹CCB-UFSC, Lab. of Behavioral Neurobiology, Brazil; ²CFM-UFSC Dept of Mathematics, Brazil

03.004 Effects of Inflammatory Preconditioning on Behavior, Molecular and Oxidative Parameters in Mice Subjected to Chronic Restraint Stress. Piton E¹, Pereira GC¹, Viero FT¹, Arboit F², Andrade LG², Portela Junior VVM², Guilherme Vargas Bochi¹, ¹UFMS Santa Maria, PPG Farmacologia, Brazil, ²UFMS Santa Maria, PPG Medicina Veterinária, Brazil.

03.005 Repeated Treatment with Sodium Butyrate Attenuated Deficits of Contextual Fear Extinction Induced by Social Defeat Stress in Mice. Coelho AA^{1,2}, Souza-Junior FJC^{1,2}, Lisboa SF². ¹FMRP-USP, Dept of Pharmacology, Ribeirão Preto, Brazil ²FMRP-USP, Dept of BioMolecular Sciences, School of Pharmaceutical Sciences of Ribeirão Preto, USP, Brazil

03.006 Effects of Ayahuasca on the Extinction of Contextual Aversive Memories in Rats. Werle I, Nascimento LMM, Bertoglio LJ UFSC, Dept of Pharmacology, Florianópolis, Brazil

03.007 Involvement of the Endocannabinoid System in the Effect of Cocaine on the Conditioned Place Preference Test: A Systematic Review and Meta-Analysis. Santos AC, Iglesias LP, Moreira FA ICB-UFMG, Lab. of Neuropsychopharmacology, Dept of Pharmacology, Belo Horizonte, MG, Brazil

03.008 Antidepressant-like Effect of the Hydroalcoholic Extract of *Solidago chilensis* and Quercitrin in Rats Submitted for Stress of Maternal Separation. Bohnen LC¹, Lindemann H¹, Buzatto MV¹, Capoani GT¹, Lopes MCB¹, Kunst FM¹, Ansolin LD¹, Bertollo AG², Medeiros J², Ignacio ZM², Gutiérrez MV³, Roman Junior WA¹. ¹Unochapecó, ²UFFS ³Universidad the Sonora, México

03.009 Effectiveness of Prototypic Antidepressants in the Forced Swimming Test: A Stratified and Network Meta-Analysis. Martins T, Bolzan JA, Triches FF, Costa JEM, Eckert FB, Lino de Oliveira C UFSC, Dpt of Physiological Sciences, PPG in Pharmacology, Florianópolis, Brazil, ²UFSC, Florianópolis, Brazil

03.010 How Antidepressants Affect Flies' Behavior? A Systematic Review. Eckert FB¹, Triches FF¹, Costa JEM¹, Suman PR², de Toni DC³, Marino-Neto J⁴, Lino de Oliveira C¹. ¹UFSC, Dpt of Physiological Sciences, PPG in Pharmacology, Florianópolis, Brazil; ²IBCCF-UFRJ Rio de Janeiro, Brazil; ³UFSC Florianópolis, Dpt of Cellular Biology, Embryology and Genetics, Brazil; ⁴UFSC Florianópolis, Institute of Biomedical Engineering, Brazil

03.011 The Activity of Phosphodiesterase 4 Favors Extinction Instead of Reconsolidation – The Potential Involvement of PKA and proBDNF. Sohn JMB^{1,2}, Cardoso NC¹, Raymundi AM¹, Prickaerts J², Stern CAJ¹ ¹UFPR, Dpt. of Pharmacology, Curitiba, Brazil; ²University of Maastricht, Dpt. of Psychiatry and Neuropsychology, The Netherlands.

03.012 Influence of *Aloysia citriodora* Palau (Cedron Paraguay) (Verbenaceae) Extract and its Main Fraction on Behavioral Performance in Experimental Models of Anxiety and Depression Induced in Mice. Martinez PEY, Báez WJA, Díaz DAI, Universidad Nacional de Asunción, Depto de Farmacología. Facultad de Ciencias Químicas, San Lorenzo, Paraguay

03.013 Disruption of Fear Memory Reconsolidation by Δ^9 -Tetrahydrocannabinol Involves Hippocampal CB1 and PPAR γ Receptors and Microglia Activation. Raymundi AM¹, Sohn JMB¹, Guimarães FS², Bertoglio LJ³, Stern CAJ¹. ¹UFPR, Dpt of Pharmacology, Curitiba, Brazil, ²FMRP-USP Ribeirão Preto, Dpt of Pharmacology, Brazil, ³UFSC, Dpt of Pharmacology, Florianópolis, Brazil

03.014 Doxycycline Induces Rapid Antidepressant-Like Effects Through Reduction of Nitric Oxide Levels. Sales AJ¹, Del Bel EA², Gomes FV¹, Joca SRL³, Guimarães FS¹ ¹FMRP-USP, Dpt of Pharmacology, Ribeirão Preto, Brazil, ²FORP-USP, Dpt of Basic and Oral Science, Ribeirão Preto, Brazil, ³Aarhus University, Dpt of Biomedicine, Denmark.

03.015 Cannabigerol Prevents Behavioral Impairments Induced by Psychotomimetic Drugs in Animal Models for Schizophrenia. Pedrazzi JFC¹, Hallak JEC¹, Zuardi AW¹, Del-Bel EA^{1,2}, Guimarães FS³, Crippa JA¹ ¹FMRP-USP, Dept of Neurosciences and Behavioral Sciences, Ribeirão Preto, SP, Brazil, ²FORP-USP, Dept of Basic and Oral Biology, Ribeirão Preto, SP, Brazil, ³FMRP-USP, Dept of Pharmacology, Ribeirão Preto, SP, Brazil

03.016 Preventive Treatment with Pro-Resolving Lipid Mediator Resolvin D5 (Rvd5) and its Precursor Docosahexaenoic Fatty Acid (DHA) Induces Anxiolytic-Like Effect in Male Rats. Zanoveli JM, Silva AHBL, Matos JHB UFPR, Dept of Pharmacology, Curitiba, PR, Brazil

03.017 Spermidine Prevents the Reinstatement of Alcohol Conditioned Place Preference. Silva A.A.1, Henriques GM1, Rocha VN1, Dias Júnior BC 1, Santos AA 1, Oliveira-Lima AJ1, Marinho EAV1, Rubin MA2, Mello CF³ ¹UESC, Dept of Health Sciences, Ilhéus, BA, Brazil. ²UFSM, Dept of Biochemistry, Center of Natural and Exact Sciences, ³UFSM, Dept of Physiology and Pharmacology, Center of Health Sciences, Santa Maria, RS, Brazil

03.018 Evaluation of the Anticonvulsant Potential of Synthetic Cannabinoid Compounds in a Seizure Model Induced by Pentylentetrazole in Zebrafish (*Danio rerio*). De Souza MM¹, Souza FL¹, Valachinsk AW¹, Teixeira NC¹, Costa BG¹, Escortegonha Pollo, LA², Biavatti, MW² ¹NIQFAR/Univali, Chemical Pharmaceutical Research Center, Brazil, ²PPGFAR-UFSC, Graduate Program in Pharmacy, Brazil

03.019 Mice Infected with *Plasmodium berghei* ANKA Strain and Healed with Antimalarial Drugs Present Late Cognitive Impairment. Dias QM, Noletto TG, Passos TG, da Silva, AC, de Oliveira, LM. Fiocruz-Rondonia, Lab. de Neuro e Imunofarmacologia

04. Inflammation and Immunopharmacology

04.001 Development of an Anti-Inflammatory Gel Containing the Extract of an Agave Genus Agro-Industrial Waste Associated with a Polyphenol. Ferreira FY¹, Fracasso JAR², Costa LTS², Ximenes VF³, Paes JTR¹, Dos Santos L¹ ¹UNESP Assis, Dpt of Biotechnology, Brazil; ²Unesp Araçatuba, PPG of Science, Brazil; ³Unesp Bauru, Dpt of Chemistry, Brazil

12.008 Potential New Compounds for the Treatment of Inflammatory Diseases: New Synthetic Structural Analogues of Cannabidiol. Lontra ACP¹, Paiva JPB¹, Invencio CGG¹, Gontijo VS², Franco GRR², Viegas-Junior C², Fernandes PD¹ ¹ICB-UFRJ, Program of Research and Drug Discovery, Lab. of Pharmacology of Pain and Inflammation, Rio de Janeiro, RJ, Brazil, ²PeQuiM-Unifal, Lab. of Research in Medicinal Chemistry, Alfenas, MG, Brazil

12.009 New Cinamoyl-N-acylhydrazone Analogues of Cannabidiol Produce Analgesic Effects in Acute and Chronic Nociception Models in Mice. Oliveira EA¹, Silva IMF², Franco GRR², Gontijo VS², Viegas-Junior C², Fernandes PD¹, Giorno TBS¹ ¹ICB-UFRJ, Drug Discovery Research Program, Pain and Inflammation Pharmacology Lab., Brazil. ²PeQuiM-UNIFAL, Research Lab. in Medicinal Chemistry, Brazil

12.010 Development and Pharmacological Evaluation of a Novel H₂S-Triamcinolone Hybrid-Releasing Nanoemulsion in Wound Resolution. Souza ALC¹, Gois GA¹, Cerqueira ARA¹, Teixeira SA¹, Muscará MN¹, Caliendo G², Lopes LB¹, Costa SKP ¹Depto de Farmacologia, Instituto de Ciências Biomédicas, Universidade de São Paulo. ²Università degli Studi di Napoli Federico II, Italy.

12.011 The Promising Treatment of Acute Inflammation with New Hybrids Capsaicin-Curcumin. Paiva JPB¹; Lontra, ACP¹; Invencio CGG¹; Ribeiro LV²; Campos TG²; Viegas-Junior C², Fernandes PD¹ ¹ICB-UFRJ, Program of Research and Drug Discovery, Lab. of Pharmacology of Pain and Inflammation, Rio de Janeiro, RJ, Brazil, ²PeQuiM-Unifal, Lab. of Research in Medicinal Chemistry, Alfenas, MG, Brazil

12.012 Lipid Nanocarriers for Chemoprevention of Breast Cancer: Co-encapsulation of Fenretinide and Perillyl Alcohol, *in vitro* Cytotoxicity and *in vivo* Localization. Malagó ID, Salata GC, Machado-Neto JA, Lopes LB. ICB-USP, Dpt of Pharmacology, Brazil

12.013 Development and Characterization of a Nanostructured Lipid Carrier for Doxycycline Encapsulation. Conceição M¹, Di Filippo LD¹, Duarte JL¹, Pedrazzi JFC², Nascimento GC^{2,3}, Del-Bel E^{2,3}, Chorilli M¹, Gremião MPD¹ ¹FCF-Unesp, Araraquara, SP, Brazil, ²FMRP-USP, Neuroscience Graduate Program, Ribeirão Preto, SP, Brazil, ³FORP-USP, Dept of Basic and Oral Biology, Ribeirão Preto, SP, Brazil

12.014 Copaifera Oilresin in the Treatment of Pulmonary Inflammation Caused by Sars-Cov-2. Almeida PG¹, Vanzan DF², Clarindo FA³, Coelho-dos-Reis JGA³, Cabral LM², Fernandes PD¹ ¹ICB-UFRJ, Drug Discovery Research Program, Lab. of Pharmacology of Pain and Inflammation ²UFRJ, Pharmacy College, Dept of drugs and Medicines. Brazil. ³ICB-UFMG, Dept of Microbiology, Lab. of Basic and Applied Virology, Minas Gerais, Brazil

12.015 Evaluation of antinociceptive and anti-inflammatory activity of *Pseudotrimezia juncifolia* (Klatt) Lovo & Gil. Minho AS¹, Almeida GP¹, Vieira RF², Rezende CM³, Fernandes PD¹. ¹ICB-UFRJ Rio de Janeiro, Brazil; ²EMBRAPA, Genetic Resources and Biotechnology, Brasília, Brazil; ³UFRJ Rio de Janeiro, Chemistry Institute, Brazil

12.016 R-954 Improve Inflammation and Infertility Parameters in Experimental Mouse Endometriotic Model. França PRC¹, Paiva JPB¹, Sirois P², Fernandes, PD¹ ¹ICB-UFRJ, Drug Discovery Research Program, Lab. of Pharmacology of Pain and Inflammation, Rio de Janeiro, Brazil, ²Laval University, CHUL Research Center. Quebec, Canada

12.017 *Acrocomia aculeata* (Bocaiuva) Pulp Oil in the Prevention and Treatment of Acute Liver Injury in Mice. Gonçalves AR¹, Nunes AA¹, Tadokoro MM¹, da Silva TC², Santos RN¹, Cogliati B², Moreno SE¹. ¹ UCDB, Graduate Program in Biotechnology, ² USP, Graduate Program in Pathology

13. Pharmacology Education and Technology

13.001 The Educational Game DiscoverRx as a Tool for Scientific Divulcation on the Drug Discovery and Development Process. Noël F¹, Xexéo G², Marques P², Mangeli E², Parreiras MV², Baptista JPH², Blanchard F^{1,2}, Böhme GA^{1,2}, Paiva BD², Maluf MBV^{1,2}, Ribeiro JASB^{1,2}, Duran J², Olaso MF², Mothé A^{1,2}, Costa IMS². ¹UFRJ, Lab of Molecular and Biochemical Pharmacology, Rio de Janeiro, Brazil; ²UFRJ, Lab of Ludology, Engineering and Simulation, COPPE, Rio de Janeiro, Brazil

13.002 Prevention of Drug Abuse Through an Academic Experience and Scientific Methodology: An Experience Through a Short-Duration Summer Course. Cunha JM, de Lima Silva AHB, De-Oliveira BR; Grieshaber LE; Waltrick APF, Visnheski BRC; Liebl B, Manuitt P; Da-Silva ACF, Ribeiro LA; Lívero FAR, Andre E, Zanoveli JM UFPR Depto de Farmacologia, Setor de Ciências Biológicas

14. Pharmacology: Other

14.001 Effects of Lithium Microdose Treatment on Strength and Muscle Mass Loss Associated with Sarcopenia in a Murine Model with Accelerated Aging. Castellano M¹, Malerba HN², Maia J¹, Marques ICS¹, Barrence FAC¹, Viel TA^{1,2} ¹EACH-USP, Lab. of Neurofarmacology of Aging, PPG Gerontology, Brazil ² ICB-USP, PPG Pharmacology, Brazil

14.002 Bystander effects of Mesenchymal Stem Cells on Aspects Relating to Cell Migration Control. Almeida B, Amon RLR, Pedro AN, Makiyama EN, Fock RA. FCF-USP, PPG Pharmacy, São Paulo, Brazil

14.003 Irradiated Mesenchymal Stem Cells: Influence of the Bystander Effect on Hematopoiesis Controls. Amon RLR, Almeida B, Pedro AN, Makiyama EN, Fock RA FCF-USP, PPG Pharmacy, São Paulo, Brazil

14.004 Use of Konjac Glucomannan-Enriched Gummy Candy on Biochemical, Oxidative Parameters, Appetite Reduction, and Anthropometric Measurements in Overweight Women. Sandri G¹, Fernandes ACS¹, Muxfeld L², Motta NG¹, Skonieski C³, Fagundes KR¹, Chaves DB¹, Suthovski G¹, Gallina AL⁴, Borstmann SMA¹, Martini MC¹, Wagner TCL¹, Benvegnú DM¹ ¹UFFS - Campus Realeza/PR - PPG em Saúde, Bem-Estar e Produção Animal Sustentável na Fronteira Sul ²Unioeste, UEM. PPG em Ciência de Alimentos ³UFMS, ⁴Unioeste-Campus Guarapuava

14.005 Development and Evaluation of Nanostructured Lipid Carriers for co-delivery of Simvastatin and Adenosine for the treatment of Difficult-to-Heal Cutaneous Ulcers Daré RG¹, Lopes LB¹. ¹ USP São Paulo, Dpt of Pharmacology, Brazil

Poster Session 2 – 28/08/2023

01. Cellular and Molecular Pharmacology

01.010 Thromboxane A2 Receptor (TP) Antagonism Improves Glucose Homeostasis and Lipid Profile in Obese Mice. Araújo RB, Cruz AP, Gonçalves TT, Salerno G, Leiria LO FMRP-USP, Lab. of Research in Metabolic Diseases, Pharmacology Department

01.011 Organotypic hippocampal culture as a model to study the interaction of glioblastoma with the brain microenvironment. Nóbrega AHL¹, Prado APS¹, Pimentel RS¹, Santos ARC², Valério RR², Martins MA¹, Frozza RL², Bernardi A¹. ¹IOC-Fiocruz, Lab. of Inflammation, Rio de Janeiro, Brazil; ²IOC-Fiocruz, Lab. on Thymus Research, Rio de Janeiro, Brazil

01.012 Examining PARP1 Expression in MPP+ Induced SH-SY5Y Model of Dopaminergic Neuron Death. Silva LDS¹, Ferrari SSAR¹, Gomes, GMO¹, Duarte CDM¹, Schlemmer F¹, Xavier MAE¹, Titze-de-Almeida S¹, Titze-de-Almeida R¹. ¹UnB Research Center for Major Themes, Division of Parkinson's Disease

01.013 trans-Cinnamic Acid Regulates Inflammatory Response and TGF- β 1-Induced Epithelial-Mesenchymal Transition in Airway Epithelium. Fidelix MSP, Santana JR, Ferreira EGA, Barros ABB, Silva JP, Barreto EO UFAL, Lab. of Cell Biology, Brazil

01.014 *In vitro* Aging Affects Epithelial Renal Cells Phenotype. Barros GMO, Araújo LS, Almeida e Silva AC, Bagri KM, Mermelstein CS, Quintas LEM ICB-UFRJ Rio de Janeiro, Institute of Biomedical Sciences, Brazil

02. Neuropharmacology

02.011 Effect of Celecoxib on Neurobehavioral and Oxidative Changes Induced by Systemic Exposure to Lipopolysaccharide in Male Mice, Capibaribe, VCC, Silva, DMA, Oliveira, JVS, Rebouças, MO, Coelho, DMN, Valentim JT, Juvêncio, BA, Bandeira SMA, Magalhães, LRF, Sales, ISL, Mallmann ASV, Carvalho MAJ, Aquino PEA, Sousa FCF Federal University of Ceará

02.032 Therapeutic Potential of β -Caryophyllene on the Olfactory and Anhedonic-Like Disorders Induced by a Rat Model of Parkinson's Disease. Santos JR¹, Gonçalves R², Razera A¹, Kerppes IP³, Carraro E², Sampaio TB^{2,4}. ¹Unicentro, Dpt. de Farmácia, Guarapuava, Brasil, ²Unicentro, Programa de Residência multiprofissional em Atenção Primária, Guarapuava, Brasil, ³Unicentro, Dpt. de Fisioterapia, Guarapuava, Brasil, ⁴UFSM, Dpt. de Farmacologia, Santa Maria, Brasil

02.033 Evaluation of the Antipsychotic-Like Activity of Microparticles of Naringin Obtained in Supercritical Medium. Daniel CF¹, Oliveira PV², Provinelli AC¹, Schio ACZ¹, Sanaiotto O¹, Kuhn KZ¹, Tavares VB¹, Dias JL², Aguiar GPS³, Siebel AM⁴, Oliveira JV², Müller LG¹. ¹Unochapecó ²UFSC, UFSC ³SEBRAE ⁴FURG

02.034 Central Inhibition of PKC β Reduces Fever and Serum Cytokine Levels in Rats. Barreto LSH, Cruz EKM, Gomes APLN, Gomes BRB, Sousa GLS, Veiga-Souza FH UnB

02.035 Neuroprotective Effect of LQFM219 in LPS-Challenged Rats. Fonseca MFR¹, Galvão GM¹, Neves EPP¹, Silva SS¹, Farias ERA¹, Campos HM¹, Ghedini PC¹, Menegatti R², Leite JA¹. ¹ICB-UFG, Dpt of Pharmacology, Goiânia, Brazil; ²UFG, Lab. of Medicinal Pharmaceutical Chemistry, School of Pharmacy, Goiânia, Brazil

02.036 Use of Cannabinoids for the Treatment of Epilepsy Associated with 1p36 Syndrome: A Case Report. Campo RM, Portilla MC, Santos FC, Novoa DA, Silva EG, Donato MF, Nascimento FP. Unila, Lab. of Medical Cannabis and Psychedelic Science, Foz do Iguaçu, PR, Brazil

02.037 Marinobufagenin Reduces Oxidative Stress in the Cortex and Hippocampus of LPS-Challenged Mice. Farias ERA¹, Lopes da Silva RR¹, Invernizzi EPF¹, Fonseca MFR¹, Silva SS¹, Campos HM¹, Pereira RM¹, Ghedini PC¹, Scavone C², Quintas LEM³, Leite JA¹. ¹ICB-UFG, Dept of Pharmacology, Goiânia, Brazil. ²ICB-USP, Dept of Pharmacology, ³UFRJ, Lab. of Biochemical and Molecular Pharmacology, Rio de Janeiro.

02.038 Protein Kinase C β Inhibition Attenuates the Production of Oxygen Reactive Species in Brown Adipose Tissue of Rats. Cajado VJ, Aguiar SCR, Gomes APLN, Sousa GLS, Souza PEN, Veiga-Souza FH. UnB

02.040 Social Isolation Stress Impairs Fear Extinction Recall in Mice: Effect is Reverted By a Fatty Acid Amide Hydrolase Inhibitor. Silva IP^{1,2}, Coelho AA^{1,2}, Lisboa SF¹ ¹FCFRP-USP, Dpt of BioMolecular Sciences, ²FMRP-USP, Dpt of Pharmacology

02.041 Investigation of the Antidepressant-like Activity of an Alkaloid Fraction obtained from *Psychotria nemorosa* (Rubiaceae). Provinelli AC¹, Oliveira BS¹, Hermes ME¹, Gerhard GM², Gasparetto RL², Couto CER², Klein LJ², Muller LG¹. ¹Unochapecó, PPG Environmental Sciences. ²Univali

02.042 Neuroinflammation Induced by *Klebsiella pneumoniae* and the Role of PPAR- γ . Almeida MAP^{1,2,3}, Costa MF^{1,2}, Moraes-de-Souza I^{1,2}, Moraes BPT^{1,2,3}, Bozza PT¹, Castro-Faria-Neto HC¹, Gonçalves-de-Albuquerque CF¹, Trindade P⁴, Silva AR^{1,2,3}. ¹IOC-Fiocruz, Immunopharmacology Lab., Rio de Janeiro, Brazil; ²Unirio, Immunopharmacology Lab., Dpt of Physiological Sciences, Rio de Janeiro, Brazil; ³UFF, PPG Neurosciences, Niterói, Brazil; ⁴UFRJ, Pharmacy Faculty, Dpt of Clinical and Toxicological Analyses

02.044 Effects of the Enriched Environment in the Release of the Hormone Irisin and its Effects for Memory in a Mouse Model of Accelerated Aging. Malerba HN^{1,2}, Castellano M², Maia J², Marques ICS², Barrence FAC², Viel TA^{1,2} ¹ICB-USP, Graduation Course on Pharmacology, ²EACH-USP. Lab. of Neuropharmacology of Aging

02.045 Low-Dose of Full-spectrum *Cannabis sativa* Oil May Improve Cognitive Impairment in Alzheimer's Disease - Cases Reports. Larentis-de-Souza B, Pauli KB, Donato MF, Nascimento FP Unila, Lab. of Medicinal Cannabis and Psychedelic Science, Clinical Trials, Foz do Iguaçu, PR, Brazil

02.046 Support Social Modulates in a Sex-Dependent Way the Effects of Aversion Triggered by dPAG Chemical Stimulation on Fear and Anxiety Responses. Lima Silva AHB, Zanoveli JM UFPR Dept of Pharmacology, Curitiba, PR, Brazil

02.047 The Importance of GPER in Neuroprotection and Angiogenesis in an *in vitro* Model of Ischemia due to Oxygen and Glucose Deprivation (OGD). Jucá PM, Duque EA, Munhoz C ICB-USP, Dpt of Pharmacology São Paulo, Brazil

03. Psychopharmacology

03.020 Validation of an Experimental Protocol to Generate a Traumatic-Like Memory in Male and Female Rats. Nascimento LMM, Soares LA, Bertoglio LJ. UFSC Florianópolis, Dpt of Pharmacology, Brazil

03.021 *In Silico* Characterization of Novel Biological Markers and Potential Therapeutic Candidates for Bipolar Disorder: A Computational Approach. Schons T¹, Ziani PR^{1,2}, Rosa PH^{1,2}, Mezzomo G^{1,2}, Rampelotto PH^{1,2}, Rosa AR^{1,2,3} ¹HCPA, Lab. of Molecular Psychiatry, Porto Alegre, Brazil, ²ICBS-UFRGS, PPG in Biological Sciences: Pharmacology and Therapeutics, Porto Alegre, Brazil, ³ICBS-UFRGS, Dept of Pharmacology, Institute of Basic Health Sciences, Federal University of Rio Grande do Sul, Porto Alegre, Brazil

03.022 Changes in Hippocampal Activity and C-FOS Expression in Female Offspring Exposed to SSRI Prenatal Treatment. Aquino ACQ, Freitas, AKMSO, Freitas-Junior, RAO UFRN, Centro de Ciências da Saúde, Natal, Brasil

03.023 Antagonism of TRPV1 Receptors Associated with FAAH Inhibition is Necessary to Facilitate the Impaired Fear Extinction in iNOS Knockout Mice. Ferreira BF¹, Sato Y¹, Marques APA¹, Fronza MG¹, Lisboa SFS². ¹USP, Dpt of Pharmacology, Ribeirão Preto, Brazil, ²USP, Dpt of Biomolecular Sciences, Ribeirão Preto, Brazil

03.024 Effects of Ayahuasca to Treat Symptoms of Pathological Grief: A Case of Series. Spicigo CC, Pereira VG, Hirata F, Silveira GO, Yanomine M, Donato MF, Fermino FA, Nascimento FP Unila, Foz do Iguaçu, PPG Bioscience, Brazil; PR; ²USP São Paulo, Dpt of Pharmaceutical Sciences, Brazil

03.025 Evaluation of the Effect of the Hydroalcoholic Extract of *Heteropterys tomentosa* on Memory in Mice. Almeida Filho OP¹, Pires JCB², Santana JVS², Freitas-Júnior RAF³, Buccini DF¹, Munhoz CD¹, Moreno SE¹ ¹USP, Dpt Pharmacology, PPG pharmacology, Brasil; ²UCDB, PPG Biotechnology, ³UFMS PPG Biotechnology

03.026 Association between Emotional State and Salivary Cortisol Concentration of Active and Non-Active Elderly Humans. Maia J¹, Pereira AAR¹, Castellano M¹, Malerba HN^{1,2}, Marques ICS¹, Viel T^{1,2}
¹EACH-USP, Lab. of Neurofarmacology of Aging, Brazil; ²ZICB-USP

03.027 Chlorpromazine Hydrochloride Liposomes is Safe in Alternative Models and Decreases the Catatonic Effect of the Free Drug in Mice. Ferreira JGJ¹, Rez TG¹, Ayres TA¹, Barbosa E¹, Rodrigues GZP¹, Verza SG¹, de Mattos CB¹, Dallegrave E², Morisso FDP¹, Gehlen G¹, Charão MF¹, Betti AH¹.
¹Feevale, Institute of Health Sciences, Brazil; ²UFCSPA, Porto Alegre, Brazil

04. Inflammation and Immunopharmacology

04.036 Plasmin Modulates the Inflammatory Response and Reduces Lung Damage in Experimental Pneumococcal Pneumonia. Cardoso C¹, Carvalho AFS², Lara ES², Zaidan I¹, Grossi L¹, Montuori-Andrade ACM¹, Augusto IL³, Caixeta RS³, Carneiro FS², Queiroz-Junior CM⁴, Felix FB⁴, Teixeira MM⁵, Braga FC¹, Tavares LP⁵, Sousa LP^{1,2,3}. ¹UFMG Belo Horizonte, PPG Pharmaceutical Sciences, Brazil; ²UFMG Belo Horizonte, PPG Clinical and Toxicological Analysis, Brazil; ³UFMG, Dpt of Clinical and Toxicological Analysis, Belo Horizonte, Brazil; ⁴UFMG, Dpt of Morphology, Belo Horizonte, Brazil; ⁵UFMG Belo Horizonte, Dpt. of Biochemistry and Immunology, Brazil; ⁶Dpt. of Medicine, Harvard Medical School, Boston, USA

04.037 The Investigational New Mexiletine Derivative JME-209 Inhibits Exacerbation on Lung Inflammation and Bronchoconstriction in Mice Subjected to Cigarette Smoke Inhalation and H1N1 Infection. Gomes HS, Coutinho DS, Cotias AC, Ferreira TPT, Almeida MD, Lopes RR, Nobrega MECG, Santos HBS, Arantes ACS, Carvalho VF, Silva PMR, Martins MA IOC-Fiocruz Lab. of Inflammation, Rio de Janeiro, Brazil

04.038 Effect of Ylang-ylang (*Cananga odorata*) Essential Oil on the Hyperalgesia, Edema Formation and Histopathological Alterations in Zymosan-Induced Arthritis Model. Lossavaro PKMB, Bonfá IS, Lencina JS, Felipe JL, Fernandes MML, Ferreira JV, Toffoli-Kadri MC, Silva-Filho SE UFMS, Pharmaceutical Sciences, Food and Nutrition College, PPG Pharmaceutical Sciences, Campo Grande, Brazil

04.040 Plasmin decreases Neutrophil Migration and reduces Adhesion to Inflamed Endothelium. Carneiro FS¹, Sugimoto MA², Zaidan I¹, Lara ES¹, Cardoso C³, Carvalho AFS¹, Caixeta RS⁵, Cooper D², Gonçalves WA⁴, Pinho V⁴, Perretti M², Sousa LP^{1,3,5} ¹UFMG Belo Horizonte, PPG Clinical and Toxicological Analysis, Brazil ²University of London, William Harvey Research Institute, London ³UFMG, PPG Pharmaceutical Sciences, Belo Horizonte, Brazil, ⁴UFMG, Dpt. of Morphology, Belo Horizonte, Brazil, ⁵UFMG, Dpt. of Clinical and Toxicological Analysis, Belo Horizonte, Brazil

04.041 Sepsis Modulates Expression of Endogenous Deoxyribonucleases Related to the NETs Clearance in Mice. Costa VF, Galant LS, Ramos AS, Rodrigues FC, Oliveira-Leandro Maísa, Schneider AH, Almeida C J L R, Wanderley CW, Cunha FQ. FMRP-USP

04.042 The Specialized Pro-Resolving Mediator, Resolvin D5, Protects the Skin from Oxidative Stress Induced by UVB Irradiation. Semeão LO, Pierotti SM, Saito P, Pinto IC, Ferrante LF, Kumagai CM, Rodrigues CCA, Vale DL, Melo CPB, Trambaioli BM, Santos KMM, Alves MG, Radoski RE, Casagrande R, UEL, PPG Health Sciences, Londrina, Brazil

04.043 Histological Analysis of the Effect of Nanoencapsulated Diclofenac Associated with Iontophoresis on Rat Joints with CFA-Induced Arthritis. Santos WP¹, Cherem KNN¹, Dornelles FN¹, Souza-Silva E¹, Lemos-Senna EMT², Tonussi CR¹ ¹LANEN-CCB-UFSC, Nociception Neurobiology Lab., Florianópolis, SC, Brazil. ²CCS-UFSC, Pharmacotechnical Lab., Health Sciences Center, Florianópolis, SC, Brazil

04.044 Food Restriction during Pregnancy Increases Susceptibility to Infections in Adult Offspring by Compromising the Alveolar Macrophages Activity. Azevedo GA¹, Negreiros NGS², Soares AW¹, Lippi BK², Candido CS², Landgraf MA³, Landgraf RG². ¹Unifesp-EPM, Dpt. of Medicine, São Paulo, Brazil. ²Unifesp-Diadema, Dpt. of Pharmaceutical Sciences, Brazil. ³Unip-Santos, Brazil

04.045 Effects of Obesity and Ovaries Removal on Expression of Glucocorticoid Receptor in Lung of Mice Submitted to Mixed Asthma. Suaiden-Schmidt A¹, Ribeiro MR¹, Oliveira MA¹, Moriya HT³, Duque-

Almeida E¹, Dragunas G¹, Munhoz CD¹, Donato Júnior J², Santana Melhado IV¹, Riffo-Vasquez Y⁴, Tavares-de Lima W¹ ¹ICB-USP, Dept. of Pharmacology, ²ICB-USP, Dept. of Physiology and Biophysics, ³EP-USP, Dept. of telecommunication and Control Engineering, ⁴Institute of Pharmaceutical Science, King's College London, UK.

04.046 Paroxetine Reduces Adrenergic Receptor Internalization. Rodrigues FC^{1,2}, Galant LS^{1,2}, Kanashiro A^{1,2}, Borges FV^{1,2}, Duarte DA³, Costa Neto CM³, Pupo AS⁴, Cunha FQ^{1,2} ¹FMRP-USP, Dept. of Pharmacology, Brazil; ²FMRP-USP, Center of Research in Inflammatory Diseases, Brazil; ³FMRP-USP, Dept. of Biochemistry and Immunology, Brazil; ⁴IBB-Unesp-Botucatu, Dept of Biophysics and Pharmacology, Brazil

04.047 Effect of Free and Nanostructured Omega 3 in Animals Challenged with Lipopolysaccharides (LPS) in the Lung. Santos FS^{1,2,3}, Moraes BPT^{1,2,4}, Silva KP⁵, Almeida MAP^{1,2,4}, Costa MF^{1,2}, Moraes-de-Souza I^{1,2}, Cunha CMCD^{1,2,4}, Bozza PT², Kaue FS^{1,2,3}, Brito MAMS¹, Castro-Faria-Neto HC², Ferrarini, SR⁴, Silva, AR^{1,2,4}, Gonçalves-de-Albuquerque CF^{1,2,3,4} ¹Unirio, Immunopharmacology Lab., Department of Physiological Sciences, Federal, Rio de Janeiro, Brazil, ²IOC-Fiocruz, Immunopharmacology Lab., Rio de Janeiro, Brazil, ³UFF, Postgraduate Program in Science and Biotechnology, Niterói, Brazil, ⁴UFF, PPG in Neurosciences, ⁵UFMT Post-Graduate Program in Health Sciences, Sinop, Brasil

04.048 Fetal Programming by in utero Food Restriction: Implications in The Response to Inflammatory Bowel Disease. Soares AW¹, Azevedo GA¹, Candido CS², Lippi BK², Negreiros NGS², Landgraf MA³, Landgraf RG². ¹Unifesp-EPM, Dpt. of Medicine, São Paulo, Brazil, ²Unifesp-Diadema, Dpt. of Pharmaceutical Sciences, Brazil. ³Unip-Santos, Brazil

04.049 Evaluation of the anti-inflammatory effect of hydrogen sulfide (H₂S) donor on experimental asthma in mice submitted to precocious ovulation. Francelino Alves V¹, Melhado IV², Ribeiro MR¹, Prata de Oliveira J¹, Dallazen JL¹, Kiataki LGS¹, Teixeira SA¹, Oliveira MA¹, Frajblat M⁴, Caliendo G³, Severino B³, Moriya H T², Muscara MN¹, Pereira Costa SK¹, Tavares-de-Lima W¹ ¹ICB-USP, Dept. of Pharmacology, São Paulo, Brazil, ²EP-USP, Dept. of Telecommunication and Control Engineering, São Paulo, Brazil, ³University of Naples, Dept of Pharmacy, School of Medicine, Napoli, Italy, ⁴UFRJ, Brazil

04.050 Assessment of Nicotine Lung Harmful Effects Triggered by Electronic-Cigarette Aerosol Exposure in Mice. Nobrega MECG, Cotias AC, Gomes HS, Lopes RR, Arantes ACS, Coutinho DS, Carvalho VF, Silva PMR, Martins MA IOC-Fiocruz, Lab. of Inflammation, Rio de Janeiro, Brazil

04.051 Identification of Interleukin-13 (IL-13) as a Biomarker in Workers Exposed to Silica Dust. Ferreira TPT¹, RIBEIRO PC², Arantes ACS¹, Guimarães FV¹, Castro-Faria-Neto HC³, Martins MA¹, Castro HA² Silva PMR¹ ¹IOC-Fiocruz, Lab. of Inflammation, ²ENSP-FIOCRUZ, Center for Studies on Workers Health and Human Ecology, ³IOC-Fiocruz, Lab. of Inflammation, Rio de Janeiro, Brazil Rio de Janeiro, Brazil

04.052 The Role of the Renin-Angiotensin System on the Hyperactivity of the Hypothalamus-Pituitary-Adrenal Axis in a Mouse Model of Type 1 Diabetes. Chaves AS, Magalhães NS, Silva PMR, Martins MA, Carvalho V IOC-Fiocruz, Lab. of Inflammation, Rio de Janeiro, Brazil Rio de Janeiro, Brazil

04.053 IL10-Induced STAT3/NFκB Crosstalk Modulates Pineal and Extra-Pineal Melatonin Synthesis. Córdoba-Moreno MO, Markus RP, Fernandes PACM USP, Dept of Physiology, São Paulo, SP, Brazil

04.054 Anti-Inflammatory Potential of Uvaol in Human Epithelial Cell Line A549 Via *in-vitro* and *in-silico* Approaches. Santana JR, Barros ABB, Ferreira EGA, Viana RS, Silva JP, Barreto E UFAL

04.055 Evaluation of the Potential of Angiotensin 1-7 - MAS Receptor Agonist - as a Therapeutic Alternative in Coronavirus-Induced Infection. Lima EBS¹, Zaidan I¹, Monteiro AHA², Cardoso C², Carvalho AFS¹, Lara ES¹, Souza JAM¹, Augusto IL³, Caixeta RS³, de Oliveira LC³, Costa VV⁴, Teixeira MM⁴, Sousa LP^{1,2,3}. ¹UFMG, PPG Clinical and Toxicological Analysis, Belo Horizonte, Brazil, ²UFMG, PPG Pharmaceutical Sciences, Belo Horizonte, Brazil, ³UFMG, Dpt. of Clinical and Toxicological Analysis, Belo Horizonte, Brazil, ⁴UFMG Belo Horizonte, Dpt. of Biochemistry and Immunology, Brazil

04.056 The Immunoregulatory Function of Mesenchymal Stem Cell on Macrophages is Affected by Zinc. Makiyama EN, Freitas S, Fock RA FCF-USP, Dept of Clinical and Toxicology Analyses, School of Pharmaceutical Sciences, University of São Paulo, São Paulo, Brazil

05. Pain and Nociception Pharmacology

05.017 The Antinociceptive Effect of Cannabinoid Receptor Agonists is Enhanced in Aspirin-Triggered Lipoxin A4 Treated-Diabetic Rats, Ferreira MV¹, Jesus CHA², Bonfim JC¹, Oliveira G¹, Liebl B¹, Verri-Junior WA³, Zanoveli JM¹, Cunha JM¹ ¹UFPR, Dept of Pharmacology, Curitiba, PR, Brazil; ² Indiana University, Dept of Psychological and Brain Sciences, , Bloomington, IN, USA; ³UEL, Dept of Pathology, Londrina, PR, Brazil

05.018 TRPA1 Modulates Nociception in a Model of Migraine-Like Behavior Caused by Unpredictable Sound Stress in Mice. Viero FT¹, Rodrigues P¹, Nassini R², Geppetti P², Trevisan G¹ ¹UFMS, Graduate Program in Pharmacology, Santa Maria, RS, Brazil. ²University of Florence, Dept of Health Science, Clinical Pharmacology and Oncology, Florence, Italy.

05.019 Impaired Mitochondrial Dynamics Contributes to Paclitaxel-Induced Peripheral Neuropathy. Martins BB¹, Hösch N¹, Ferreira J², Zambelli VO¹ ¹IBu, Lab. of Pain and Signaling, São Paulo, Brazil; ²ICB-USP, Dpt. of Anatomy, São Paulo, Brazil

05.020 Study of New Natural Derivatives Inhibitors of the P2X7 Receptor in Inflammatory Pain and Arthritis in Mice. Galvão RMS^{1,2}, Salles JP^{2,3}, Miranda ALP², Faria RX^{1,4} ¹IB-UFF, Graduate Program in Science and Biotechnology, Brazil, ²UFRJ, Lab. of Studies in Experimental Pharmacology, Brazil, ³UFRJ, Graduate Program in Pharmacology and Medicinal Chemistry, Brazil, ⁴IOC, Lab. for Environmental Health Assessment and Promotion, Brazil

05.022 Anti-inflammatory and Antinociceptive Activity of the Hydroalcoholic Extract of *Heteropterys tomentosa* in Mice. Freitas-Júnior RAF², Ferraz GB², Almeida-Filho OP¹, Santana JVS², Moreno SE², Buccini DF, Munhoz CD¹ ¹ICB-USP, Lab. of Neuronal Endocrine Pharmacology and Immune Modulation, Dept of Pharmacology, São Paulo, Brazil, ²UCDB, Lab. of Pharmacology, Biotechnology Program, Mato Grosso do Sul, Brazil

06. Cardiovascular and Renal Pharmacology

06.021 The Influence of C3a on Matrix Metalloproteinase (MMP)-2 Activity and Oxidative Stress in Angiotensin-II-induced Hypertension. Ramos LVR, Mello MM, Castro MM FMRP-USP, Dept of Pharmacology.

06.022 Effects of beta-Caryophyllene in the Cecal Slurry Model of Sepsis. Mariot LN¹, Queiroz LY¹, Delfrate G¹, Alves GF², Nardi GM, Sordi R¹ ¹UFSC, PPG in Pharmacology, ²UniTO, PPG in Pharmaceutical and Biomolecular Sciences

06.023 Evaluation of the Late Effects of Topiramate Treatment during Childhood on Baroreflex Control in Male and Female Rats. Miguel MVO, Silva KGN, Bonancea AM, Oliveira GR, Pelosi GG ¹UEL, Dpt. of Physiological Sciences, PPG of Physiological Sciences, Brazil

06.024 Methylene Blue Preserve the Microcirculation and Reduces Death in Rat Sepsis. Dantas PB¹, Mestriner F¹, Dugaich VF¹, Barbosa JM¹, Fagundes A¹, Couto AES¹, Becari C², Evora P¹, Ribeiro MS¹ ¹FMRP-USP, Dept of Surgery and Anatomy, Ribeirão Preto, SP, Brazil, ²FOB-USP, Dept of Biological Sciences, School of Dentistry of Bauru, University of São Paulo, Bauru-SP, Brazil

06.025 FoxO1 O-GlcNAcylation on Vascular Endothelial Function. Pedersoli CA¹, Silva-Neto JA¹, Duarte DA¹, Gonçalves DAP², Silva NLE³, Silva JFG¹, Gasparini MV⁴, Machado MR¹, Gonçalves TT¹, Bressan AFM¹, Ketteluch IC³, Navegantes LC⁵, Carneiro FS¹, Tostes RC¹. ¹USP, Dpt. of Pharmacology, Ribeirão Preto, Brazil; ²UFMG, Dpt. of Physical Education, Belo Horizonte, Brazil; ³FMRP-USP, Dpt. of Dept of Biochemistry and Immunology; ⁴FMRP-USP, Dpt. of Cellular and Molecular Biology and Pathogenic Bioagents, Brazil; ⁵ FMRP-USP, Dpt. of Physiology, Brazil

06.027 The Deletion of Elastase-2, an Angiotensin-II Forming Enzyme, Changes Typical Abdominal Aortic Aneurysm Phenotype in Mouse Model. Mestriner F¹, Ribeiro MS¹, Couto AES¹, Dugaich VF¹, Kovacs HZ¹, Francisco DF¹, Corsi CAC¹, Vasconcelos JL¹, Bruch P¹, Melo MMB², Neto J², Nakagi VS¹, Costa RM², Castro MM², Tostes R², Becari Christiane^{2,3} ¹FMRP-USP, Division of Vascular and

Endovascular Surgery, Dept of Surgery and Anatomy ²FMRP-USP, Dept of Pharmacology, Ribeirão Preto, SP, Brazil. ³FOB-USP, Dept of Biological Science, Bauru-SP, Brazil

06.028 Administration of Chloroquine during Pregnancy Does Not Alter the Hemodynamic Response of Offspring in Adulthood. Bonancea AM, Miguel MVO, Oliveira GR, Pelosi GG. ¹UEL, Dpt. of Physiological Sciences, Brazil

06.029 Sepsis-Induced Differential Electrocardiographic Changes in Male and Female Rats Hahmeyer MLS, Silva-Santos, JE ¹UFSC, Dpt. de Farmacologia, Brazil

06.030 Reduction of Sirtuin 1 Expression in Perivascular Adipose Tissue of the Thoracic Aorta During Aging in SAMP-8 Mice. Alves AS, Marques BVD, Akamine EH ICB-USP, PPG Pharmacology, Brazil

06.031 Vascular Effects of Hydrogen Sulfide (H₂S)-Donors: Mitochondria as New Targets. Marques LAC, Teixeira SA, Costa SKP, Muscará MN USP-ICB Farmacologia São Paulo SP Brazil

06.032 Glycolytic Profile of CD4+ T Cells and Cardiac Hypertrophy and Increased Blood Pressure in a Mouse Model of Gender-Affirming Hormone Therapy (GAHT). Oliveira-Neto JT¹, Santos JD¹, Oliveira CV², Cebinelli GCM², Machado MR¹, Souza FM⁴, Rodrigues D¹, Soares HAS⁴, Silva MC⁴, Silva CAA³, Santana da Silva J⁴, Fazan-Júnior R³, Cunha FQ², Farias-Filho JCA², Tostes, RC¹ ¹FMRP-USP, Dept. of Pharmacology, ²FMRP-USP, Dept. of Immunology, ³FMRP-USP, Dept. of Physiology, ⁴Fiocruz, Bi-Institutional Research Platform in Translational Medicine

Lectures Abstracts

Courses

Pre-Congress Course

Learning the Discovery and Development Process of New Drugs and Medicines with the Screener Educational Game (Aprendendo o Processo de Descoberta e Desenvolvimento de novos Fármacos e Medicamentos com o Jogo Educacional Screener) Chair: François G. Noel (UFRJ)

The purpose of this course is to show how we can approach the complex process of drug discovery and development in an enjoyable and interactive way, using the educational game SCREENER (<https://www.screener.com.br/>). This game, created by a multidisciplinary team from UFRJ, was endorsed and distributed by SBFTE and has been used since 2022 by postgraduate courses (target audience) and even undergraduate courses that have shown interest in using it. SCREENER is a collaborative game, a hybrid of board and cards with online resources. The game mimics the process of drug discovery and development, from validating a target to registering the new drug with the regulatory agency and can be played individually (self-learning) or with the help of a monitor who assists up to six players/teams. The goal of the game is to collect cards that represent tasks that must be performed throughout the 7 stages of the process. The 29 task cards are categorized into four major areas (efficacy, safety, pharmacokinetics, and pharmaceutical development) and must be purchased sequentially. The game ends when the last card, which represents FDA approval, is collected. The player who has collected the most task cards wins. Classic game features, such as decision making and challenge, have been incorporated. More detailed information about the tasks and technical terms is available through QR codes on the cards. The vagaries of this long and costly process are mimicked by bonus/setback cards that must be read when the six-sided die indicates the number 6. In this course limited to 12 participants (6 teams of 2), selected among students and teachers who submit a letter of intent, we will present the rules of Screener and play the entire game over 7 hours of activity. The activity will be conducted in the Portuguese language.

Cr1 – Animal Models and their New Technologies for Neuroscience Studies (Modelos Animais e suas Novas Tecnologias para Estudos em Neurociência)

Animal models of Parkinson's Disease with an Emphasis on Replicability of the Progressive Nature of the Disease (Modelos animais da Doença de Parkinson com ênfase na replicabilidade da natureza progressiva da doença). José Ronaldo dos Santos, Ph.D., Department of Bioscience, Federal University of Sergipe

Parkinson's Disease (PD) is a chronic and progressive neurodegenerative disorder characterized mainly by the death of dopaminergic neurons in the substantia nigra pars compacta (SNpc). The symptoms of PD involve motor (tremors, muscle rigidity, bradykinesia) and non-motor (attention deficit, impairments in learning, recognition memory, and executive tasks, balance disturbances, anxiety, depression, sleep disorders, and sensory impairments) changes. Studies have shown that non-motor changes may precede motor changes in PD and that animal models are suitable tools to better understand these mechanisms. However, few models are capable of mimicking the progressive nature of the disease, in which it is possible to evaluate the non-motor, motor, and physiological aspects in the same animal, throughout the progression of the pathology. Among the developed animal models is the reserpine model, in which animals are chronically treated with low doses of this drug that blocks the activity of the vesicular monoamine transporter protein (VMAT). Through this model, it is possible to understand changes in various neurotransmission pathways (dopaminergic, serotonergic, noradrenergic), motor progression, non-motor changes, the temporal course of the inflammatory process in areas involved with PD symptomatology, in addition to the retrograde degeneration process in dopaminergic and serotonergic pathways. The application of the chronic reserpine-induced PD model is also highlighted in the study of new compounds with

antioxidant, anti-inflammatory, neuroprotective, and antiparkinsonian action. Studies with the progressive model of PD induced by reserpine have grown in recent years, gaining prominence in the international literature and contributing to the expansion of knowledge about the progressive nature of the disease. Financial Support: CNPq; CAPES

Experimental models of pain and nociception: new approaches in the study of pain in rodents and humans (Modelos experimentais de dor e nocicepção: novas abordagens nos estudos da dor em roedores e em humanos). Cristiane Flora Villarreal. Faculdade de Farmácia, Universidade Federal da Bahia

Clinical pain management is a therapeutic challenge due to the high and growing worldwide prevalence of chronic pain, associated with low efficacy and adverse effects of available analgesics. Although animal models are necessary tools for the development of new drugs, the enormous advances in scientific knowledge obtained with these models have not led to the development of truly new, effective and safe analgesics for clinical practice. This low translational power in the field of pain may reflect the complexity of the pain phenomenon, but also the need for a change in the experimental paradigm, with the incorporation of tests that are more similar to clinical pain states and measures beyond withdrawal reflexes. Despite differences in the clinical manifestations of pain syndromes, most current experimental models only cover simple measures of reflexes, and the absence, rather than the presence, of behaviors as evidence of analgesic efficacy. The unsatisfactory translational success of these models has pointed to the need for new approaches that focus on functional restoration and integrated behaviors in the central nervous system during painful conditions. Another increasingly debated topic is the need to develop more studies on human pain. This demand must overcome obstacles such as ethical aspects, in addition to the subjectivity and variability of the painful experience. In order to obtain more objective measures, tools and protocols for quantitative measurement of sensitivity and pain have been developed and used in clinical studies. Given this scenario, this course is aimed at discussing advances in experimental models in the field of pain and nociception. New measurement tools and approaches to pain studies will be presented, both in rodent models and in human pain.

Cr2 – Adrenal Gland Steroids in Health and Disease (Esteroides da Glândula Adrenal na Saúde e na Doença). Maria Christina W. Avellar (Unifesp-EPM)

The course aims to present updated data on steroidogenesis in the adrenal gland, emphasizing the intermediate/precursor hormones formed in the adrenal itself or, at a distance, in peripheral and central tissues, in humans and other species of relevance in research and clinical, medical and clinical practice. veterinary. The relationships of these events in health and disease will be addressed based on the combination of data and the most recent examples of basic and clinical research in the area and therapeutic applications.

Cr3 – Playfulness in the Classroom: a Case of Gamification for Teaching Pharmacology (O Império do Lúdico na Sala de Aula: um Case de Gamificação para o Ensino da Farmacologia). Francislainé Aparecida dos Reis Lívero. Departamento de Farmacologia – Universidade Federal do Paraná

In the modern educational landscape, the role of traditional teachers as information transmitters has transformed into that of organizers and partners in student learning. Both teachers and students play an equally active role in the learning process, and active learning strategies encompass a variety of collaborative activities in the classroom. However, motivation can pose a challenge for students, particularly when they fail to find the purpose in an activity. In this regard, gamification can render the teaching and learning process more active and participatory. Over the past years, there has been a growing interest in the application of gamification in education, which, though still in emergent stages, can be defined as the application of game design elements to learning activities. Its aim is to motivate students by creating an engaging learning experience that keeps them focused on the task of learning and its application. Nevertheless, gamification presents a significant challenge for education,

especially in higher education institutions entrenched in a traditional context. This challenge can be partly attributed to the lack of training among educators in utilizing this methodology. Thus, the objective of this course is to introduce and discuss gamified strategies for pharmacology teaching in order to promote meaningful learning among scholars. Fifteen gamification strategies will be presented, including the optimal timing within a lesson for each activity, how to execute them, as well as the advantages and challenges associated with each game. The aim is to provide participants with teaching strategies that facilitate meaningful learning for students, enhance their engagement, and make classes more enjoyable. (CNPq, processo nº. 150258/2023-2)

Lectures

L2 – Interpretable Machine Learning Approaches for Drug Repurposing and Side Effect Prediction. Alberto Paccanaro (FGV)

A cell can be viewed as a set of complex networks of interacting biomolecules. In this talk, I will present novel machine learning algorithms for solving problems that can be phrased in terms of inference in such large-scale networks. I will begin by presenting a new approach that combines ideas from matrix factorization and network medicine to predict host centric antivirals. Our predictions have higher accuracy than state-of-the-art methods; our approach does not rely on known drug-virus associations and could be applied to new diseases and drugs. I will then present a machine learning approach for the prediction of drug side effects. This algorithm, which is based on matrix factorization, is the first that can predict the frequency of drug side effects in the population. The main idea behind all these algorithms is to find embeddings for the different entities involved (drugs, side effects, viruses, and proteins) in a low dimensional space – we discover representations for them that make explicit some of their features that are relevant for the problem. I will show that these representations can be interpreted, thus leading to explanations for the predictions that may shed some light on the biological phenomena underlying these problems.

L3 – Neuroimmune Interactions and Arthritis Pain in Neurodegenerative Conditions. Marzia Malcangio Wolfson CARD, King's College London, London UK

A significant proportion of patients with neurodegenerative diseases are affected by alteration of pain sensation. Alzheimer's disease (AD) patients have a compromised ability to report pain and untreated pain contributes to psychiatric symptoms of dementia. Neuronal degeneration provokes an intense reaction by microglia which, depending on their phenotypes of activation, may give rise to pain. I will discuss how inflammatory arthritis affects spinal cord microglial activity and how neuron-microglia communication is altered in the TASTPM transgenic mouse model of AD. Our evidence shows that 6 months old TASTPM display cognitive impairment, brain amyloid pathology and reduced thermal sensitivity compared to WT controls, which is in accordance with the observation that AD patients exhibit reduced pain intensity compared to cognitive-intact individuals. Under conditions of persistent inflammatory pain, spinal microglial activity plays a mechanistic role in central sensitisation, as attenuation of microglial activation correlates with reduced pain-like behaviours. I will show that in persistent inflammatory arthritis, the release of galectin-3 from primary afferent terminals in the dorsal horn mediates inflammatory allodynia via interaction with Toll like receptor 4 (TLR4) in microglia. However, this neuron-to-microglia communication pathway is defective in TASTPM mice that display reduced inflammatory allodynia and reduced spinal cord microgliosis. Indeed, a cluster of TASTPM microglia lacks expression of TLR4 and cannot respond to Gal-3 which is expressed and released by primary afferent fibres in the dorsal horn. Thus, we identified a mechanism through which nociceptors respond to joint inflammation and establish nociception through the activation of microglia. Sensory neuron-derived Gal-3 activates microglial TLR4, and promotes nociceptive signalling via the release of cytokines in the dorsal horn. Intriguingly, in the spinal cords of the TASTPM mouse model of AD, the emergence of a subset of microglia devoid of TLR4 is associated with milder inflammatory nociception. Supported by EU Horizon 2020

research and innovation programme “TOBeATPAIN” under the Marie Skłodowska-Curie grant agreement No 764860

L4 – Novel Roles for GRK2 in the Failing Heart. Walter J. Koch, PhD Duke University Medical Center Department of Surgery

Over the last 3 decades, my laboratory has been investigating the role of cardiovascular G protein-coupled receptor (GPCR) kinases (GRKs) in several in vivo model systems. Original studies were done in transgenic mice where GRK-based transgenes were targeted specifically to the heart. We have found that one GRK, GRK2, plays a significant role in the development of pathological cardiovascular conditions including heart failure (HF). GRK2 has been found to be elevated in the heart when it has compromised contractile function and these changes appear to be maladaptive and pathological and targeted inhibition of GRK2 is therapeutic in certain cardiovascular disorders. Indeed, cardiac expression of a GRK2 inhibitor, known as the bARKct, has rescued several animal models of HF including large animal pre-clinical models. More recently, we have found GRK2 to have non-GPCR actions in the myocyte due including effects on insulin signaling and other metabolic effects including those in mitochondria. It also can localize in mitochondria after oxidative stress where it can induce cell death. We have recently identified the mitochondrial F1 ATP synthase as a novel binding partner and substrate for GRK2 in the myocyte and heart and exploring its physiological and pathological significance. Thus, we have identified GRK2 as critical regulator of cardiovascular signaling, metabolism, myocyte survival and function, which have wide implications for future research in order to elucidate novel roles for this GRK in cardiac physiology and disease. In addition to using the bARKct, we are developing small molecule inhibitors of GRK2 and the latest data with these pharmacological agents will be presented. Overall, we have found GRK2 up-regulation in the stressed and injured heart to be pathological and its inhibition for the treatment of HF is nearing translation. These studies were supported by multiple grants from the National Institutes of Health (NIH) since 1998 and funding from the American Heart Association (AHA). Dr. Koch holds a MERIT Award from the AHA. Key Reference: 1. Pflieger J, Gresham K, Koch WJ: G protein-coupled receptor kinases as therapeutic targets in the heart. *Nat Rev Cardiol* 16:612-622, 2019.

L5 – How Inflammatory are Inflammatory Chemokines in Patients? Laboratory of Molecular Immunology, Rega Institute, KU Leuven, Herestraat 49, box 1042, 3000 Leuven, Belgium

Chemokines are crucial proteins for the control of leukocyte migration through interaction with G protein-coupled chemokine receptors (GPCR) and glycosaminoglycans (GAG) during homeostatic and inflammatory processes and affect cancer growth and metastasis. The about 50 chemokine ligands that activate over 25 GPCR are divided in inflammatory and homeostatic chemokines. During recent years, posttranslational modification (PTM) of mainly inflammatory chemokines, has been associated with altered activity ranging from enhanced potency to loss of function, antagonistic effects or even altered GPCR specificity. PTMs on chemokines involve proteolytic truncation, nitration, citrullination and glycosylation and the receptors may be modified and regulated by tyrosine sulfation and glycosylation. In view of the interaction of the N-terminus of chemokines with GPCR, mainly N-terminal PTM were intensively studied. However, we recently showed that also C-terminal PTM of CXCL10 significantly affects its receptor and GAG interactions and biological activities in vitro and in vivo. Since classical immunoassays that use chemokine-specific antibodies fail to discriminate between chemokine proteoforms and glycoforms, detection of chemokines in patient samples gives limited information on the activity of the detected proteins. Thus, alternative methods are needed to discriminate between active, inactive and antagonistic chemokines. By immunoaffinity pre-purification followed by optimization of top-down ion trap mass spectrometry, we develop novel methods to quantify individual proteoforms of inflammatory chemokines in plasma, synovial fluids and bronchoalveolar washes. Clear differences in proteoform presence of CXCL8, CXCL10 and CXCL12 were discovered in arthritis, lung transplant and pneumonia patients. Funding was

provided through research fellowships and grants from the Rega Foundation, KU Leuven, FWO Vlaanderen and the European Union.

L7 – Resolution Pharmacology to Control the Morbidity of Chronic Diseases. Mauro Perretti, Jianmin Chen, Andreas Margraf, Lucy V Norling and Dianne Cooper The William Harvey Research Institute, Queen Mary University of London, United Kingdom

The resolution of inflammation identifies an area of biology which has been elucidated over the last twenty years or so, whereby mediators and mechanisms are activated in our body to ensure time- and spatial-control of the inflammatory reaction, which then will terminate, or resolve. Appreciation that acute inflammation resolves spontaneously brings two immediate implications: i) pathology characterised by persistent inflammation could be consequent of an inadequate engagement of pro-resolution pathways and ii) current pharmacological therapies targeting inflammation have not exploited the biology of the resolution phase to inform innovative drug discovery programs. Thus, resolution pharmacology brings together approaches that could be deployed to promote pro-resolving mechanisms to correct, temper or mitigate on-going inflammation. To this end, a viable approach is to use agonists which activate pro-resolving receptors, setting in motion reparative processes within the patient. Equally pivotal is to define the best application for pro-resolving based therapies. One use could be to substitute current therapies, offering an alternative therapeutic approach. Another way is to complement current therapies when, for instance, there could be risk of immunosuppression associated with prolonged use. Pro-resolving based therapies are predicted to modulate the immune system, if not to fortify it, without causing immunosuppression. A third way is to harness resolution pharmacology to prevent or treat secondary organ injury typical of chronic conditions like arthritis, diabetes or obesity. Patients affected from rheumatoid arthritis have double the risk for cardiovascular diseases, including heart failure [*Lancet* 2022; 400: 733–43], and reduced lung function. In a transgenic model of K/BxN F1 mice, we could detect onset of heart failure with preserved ejection fraction, accompanied by diastolic dysfunction, after full blown arthritis, that is from week 4 or 5 of age, with maximal heart defect between week 12 and 15 [*PNAS* 2021; 118(38):e2020385118]. Our focus was the annexin A1 (AnxA1)/formyl-peptide receptor type 2 (FPR2) pathway. The cardiac diastolic dysfunction, monitored by echocardiography, was associated with immune cell infiltration as well as fibroblast proliferation. As the hearts of K/BxN F1 mice displayed augmented expression of Fpr2 mRNA, we treated mice prophylactically (from week 4 to week 8) or therapeutically (week 8 to week 15) with human recombinant AnxA1 (1 µg s.c. daily): the cardiomyopathy was halted or reversed, respectively. Cardiac protection was associated with reduced fibroblast numbers, reduced fibroblast activation and macrophage skewing towards an M2-like polarization. To address both heart and lung dysfunction in inflammatory arthritis, a novel model was developed (unpublished). In this case, pharmacological treatment was performed with small molecules: BMS235 (selective for Fpr2) and C43 (dual Fpr1/Fpr2 agonist). This experimental design allowed us to address one important question in the field, whether selective Fpr2 agonism would bring added value in resolution pharmacology as compared to the most commonly available dual Fpr1/Fpr2 agonist. Published work indicates that experimental myocardial infarction there is no gain for a selective compound [*J Am Coll Cardiol Basic Trans Science*. 2021;6(8):676– 689]. These new data will be discussed in the context of therapeutic innovation that resolution pharmacology can afford. In summary, time is ready to harness the knowledge generated in the biology of the resolution of inflammation to guide the development of novel medicines to treat the inflammatory component of chronic diseases.

L8 – The Allergic Effector Unit and the Mast Cells as Masterminds from Inflammation to its Resolution. Have we found New Druggable Targets? Prof. Francesca Levi-Schaffer, Pharmacology and Experimental Therapeutics Unit, Institute for Drug Research, School of Pharmacy, Faculty of Medicine, The Hebrew University of Jerusalem

The pivotal effector cells of allergic inflammation (AI) are the mast cells and the eosinophils. Mast cells, as activated by IgE-dependent mechanisms via allergens, are the recognized starters

while eosinophils infiltration and persistence in the inflamed tissue with the mast cells are the accepted features of the late stage and of the chronic outcome of allergy. Asthma and other allergic diseases' management recently has benefited from the biological revolution, with an array of novel immunomodulatory therapeutic and investigational tools targeting different players of AI at precise pathophysiological steps. Prominent examples include therapeutic monoclonal antibodies against cytokines, alarmins, and their receptors and small-molecule modifiers of signal transduction mainly mediated by Janus kinases and Bruton's tyrosine kinases. However, and despite the new therapeutic options, meaningful improvements for allergic patients are not always achieved. For instance, approximately 30% of patients with severe asthma do not respond satisfactorily to classic medications nor to tailored biologics. In the past we defined a pro-inflammatory cross-talk between mast cells and eosinophils that we named the Allergic Effector Unit (AEU). We found that mast cell/eosinophil interactions result in increased eosinophils chemotaxis, survival, degranulation, cytokine production and in increased mast cell survival, IgE-dependent and independent degranulation and cytokine production. These effects are mediated by both released mediators (soluble interactions) and by receptor/ligands binding (physical interactions). Prominent players of the activating "physical" AEU are the two activating receptors (ARs)/ligands CD48 and 2B4. Yet, at the same time we also described the presence and functional activity of two inhibitory receptors (IRs), i.e., CD300a and Siglec-7, on mast cells and on eosinophils that can indicate a possible anti-inflammatory or even pro-resolution activity of the cross-talking cells, within the AEU and in the allergic inflamed environment. Moreover, we recently found that IgE-activated mast cells produce the pro-resolving lipid mediator resolving D1 and should have resolution activities in allergy. The goal of our research is to define potential new and better targets for immunopharmacological intervention in allergic diseases by blocking ARs, i.e., CD48, by activating IRs, i.e., CD300a and Siglec-7, and by inducing a pro-resolution phenotype in mast cells. In the frame of the first strategy, we found that the GPI receptor CD48 is significantly upregulated on human and murine asthma on mast cells and eosinophils and in the presence of *S. aureus*, the prominent bacteria infecting atopic tissues. We have therefore studied CD48 modulation *in vitro* and *in vivo* and the outcome of its blockade and found that CD48 can be a key target to be blocked in allergic diseases. On the other hand, as an example of the second strategy, we have found that CD300a expression is modulated during allergic responses, and that its activation on mast cells by bispecific antibodies directed to CD300a and IgE can downregulate their severity. Therefore, agonistic and mast cell targeted anti-CD300a antibodies are an important tool for treatment of allergic diseases. Lastly, we found that mast cell can produce the pro-resolving lipid mediator Resolvin D1 and hence have the potential of not only initiating allergy but also resolving it. Thus, our strategy is to treat allergic diseases by inhibiting activation and/or by activating inhibition mostly of mast cells and the AEU, and by bolstering the pro-resolution properties of the mast cells. Translationally this strategy will have to take into account the complexity of allergic patient endotypes. This research has been funded by grants from the United States-Israel Binational Science Foundation (2015045), Israel Science Foundation (343/22), Rosetrees Trust (UK), Aimwell Charitable Trust Foundation (UK), Emalie Gutterman Memorial Endowment Fund (USA).

Women in Pharmacology in Brazil Award

An Academic Career guided by Shock and Lipids. Regina de Sordi, UFSC

I have dedicated my research mainly studying lipid mediators in systemic inflammation associated with septic shock (SS) and hemorrhagic shock (HS). SS may occur after an infection and the HS is due to severe hemorrhage. Both types of shocks are associated with organ injury and dysfunction, poor prognostic, and high mortality rate. No specific treatment to prevent organ injury is available; therefore, a better understanding of the physiopathology and new treatment strategies are needed. In this context, we evaluated pro-resolving lipid mediators in shock. Lipoxins and resolvins are released during systemic inflammation and play

counterregulatory roles to promote inflammation resolution. Lipoxins are formed from arachidonic acid (AA) exerting bioactivities via their receptors FPR2/ALX. In sepsis, we showed an initial increase of lipoxin A4 (LXA4) and FPR2/ALX, which was associated with bacteria spreading and poor outcome. On the other hand, LXA4 administered in late sepsis was beneficial to the host as it controls the excessive inflammatory response and protected septic mice from death. Therefore, LXA4 exhibited a dual role in a sepsis model. In trauma/HS, we found a reduction of resolvin D1 (RvD1) levels in the plasma of patients. Using a reverse-translational approach, we have investigated the effects of RvD1 on the organ injury and dysfunction associated with HS in rats. We found that synthetic RvD1 on resuscitation attenuated the multiple organ failure associated with HS by a mechanism that involves inhibition of NF- κ B. More recently, we have turned our attention to the lipid mediators from the endocannabinoid system. AA is also a precursor of the endocannabinoids, which are ligands of CB1 and CB2 receptors. CB2 receptors are mainly expressed in immune cells, and we detected a reduction of CB2 in lungs and macrophages of septic animals in late sepsis, suggesting a dysregulation of this system during systemic inflammation. A CB2 agonist reduced local and systemic inflammation, increased survival rate and the levels of IL-10 in septic animals, suggesting that receptors may also have a pro-resolution role. In summary, lipid mediators have an important role in systemic inflammation and are promising targets to reduce organ damage associated with septic and hemorrhagic shocks. Support: CAPES, CNPq

Symposia

S1 – Novel Endothelial-Derived Catecholamines

Synthesis, pKa Determination and Redox Properties of Catecholamine Derivatives. Laryn W. Peterson¹, Valerie E. Williams¹, Emma G. Gruss¹, Gisela Xhafkollari¹, Gabriella A. Krisanic¹, Mary Kathleen Luetkemeier¹, Trevor R. Squires¹, Kameron L. Klugh¹, Kudzai L. Nyamkondiwa¹, Keri L. Colabroy² ¹Department of Chemistry, Rhodes College, Memphis, TN 38112, USA; ²Department of Chemistry, Muhlenberg College, Allentown, PA 18104, USA

Dopamine and related catechols are ubiquitous molecules in both the human body and in other organisms, found as neurotransmitters, precursors to antibiotics, marine adhesives and plant woody tissue. Dopamine levels in the body are delicately balanced by a number of enzymes, receptors and transporters and imbalances often result in diseases and other disorders. We previously reported the synthesis of dopamine derivatives substituted at the 6-position with various electron-donating or withdrawing substituents and the effect of the substituents on some of their physical properties. Recently, we have recently expanded the series to include 3,4-dihydroxyhydrocinnamic acid and L-DOPA derivatives. The synthesis of this important toolkit of compounds and trends in their physical properties will be discussed.

Synthesis and chiral resolution of 4-nitro and 7-nitropropranolol and preparation of other nitrated or halogenated dopamine congeners. Francesco Frecentese¹, Rosa Sparaco¹, Angela Corvino¹, Ferdinando Fiorino¹, Elisa Magli¹, Elisa Perissutti¹, Beatrice Severino¹, Vincenzo Santagada¹, Gilberto De Nucci², Giuseppe Caliendo¹ ¹Department of Pharmacy, School of Medicine, University of Naples Federico II, Via D. Montesano 49, 80131, Naples, Italy; ²Department of Pharmacology, Faculty of Medical Sciences, State University of Campinas (UNICAMP), Campinas 13083-970, SP, Brazil

Nitrate derivatives of catecholamines are attracting the attention of numerous research groups to define their physio-pathological functions. In particular, 6-nitrodopamine and other nitro-catecholamines (i.e. 6-nitrodopa, 6-nitroadrenaline) have been identified indicating that endogenous nitration of the classical catecholamines occurs. To investigate whether drugs could undergo to the same nitration process, we synthesized 4-nitro- and 7-nitropropranolol as probes to evaluate the possible nitration of the propranolol. Chemical synthesis, chiral resolution and enantiomers absolute configuration, with the aim of evaluating the possible enantioselectivity of the receptor interactions involved, have been studied and will be discussed. The separation of the enantiomers in very high yields and excellent enantiopurity was achieved

by chiral HPLC. Finally, we used Riguera's method to determine the absolute configuration of the enantiomers, through double derivatization with MPA and NMR studies based on the sign distribution of $\Delta\delta_H$. Recently we have expanded our studies to the preparation of nitrated or halogenated catecholic and non-catecholic compounds, such as veratrol derivatives.

Production/release of 6-nitrodopamine by human umbilical cord artery in vitro: NO oxidative clues? Marcelo N. Muscará Dept. of Pharmacology – Institute of Biomedical Sciences / University of São Paulo. São Paulo, SP, Brazil.

The spontaneous release of dopamine and some 6-substituted dopamine derivatives (including 6-nitro dopamine – 6-ND) has been observed from vascular tissues such as human umbilical artery (HUA) and aorta from reptiles (tortoise and snakes) or non-human primates, as well as non-vascular tissues, such as rat atria and ventricles and human ductus deferens. Under nitric oxide (NO) synthase (NOS) inhibition, 6-ND synthesis/release is significantly reduced, although not abolished, thus indicating the existence of a NOS-independent biosynthetic pathway for this nitration reaction. One possible NOS-independent pathway for dopamine nitration could involve the chemical reduction of the endogenous anions nitrite (NO_2^-) and/or nitrate (NO_3^-), since these NO oxidation products may act as reservoir. In fact, enzymes such as hemoglobin, myoglobin, xanthine oxidoreductase and cytochrome P450 reductase, can catalyze NO_2^- or NO_3^- reduction to render NO. Furthermore, peroxidases can catalyze one- and two-electron oxidation reactions of small anionic molecules, such as halides, thiocyanate and nitrite utilizing hydrogen peroxide. Depending on the conditions (e.g., O_2 contents, pH), NO_2^- can undergo both oxidation and reduction, thus generating different nitrogen oxides (such as NO, NO_2 , N_2O_3 , etc.) which can also mediate catecholamine nitration. It is thus clear that the precise knowledge of the involved species and mechanisms beyond 6-ND synthesis/release is of central importance in order to allow the pharmacological modulation of this dopamine derivative effects. Financial support: FAPESP, CNPq, CAPES.

S2 – Energy Transfer-Based Technologies (BRET, HTRF) to Characterize Receptor Function

Energy Transfer-based technologies (BRET, TR-FRET) to identify new therapeutic targets. Erika Cecon. Institut Cochin-Université Paris-Cité, CNRS, INSERM; Paris, France

Ligand-receptor and protein-protein interactions are involved in many (if not all) cellular processes that are essential for a functional system. Identifying and assessing the dynamics of these interactions are essential steps to understand the molecular basis of physiological versus pathological conditions, as well as to disclose potential drug targets. We have recently developed and applied several cutting-edge innovative assays based on energy transfer technologies, such as Bioluminescence Resonance Energy Transfer (BRET) and TR-FRET (Time-Resolved Fluorescence Resonance Energy Transfer), or on enzyme complementation techniques, mainly of the Nanoluciferase (Nluc) enzyme, to disclose new molecular mechanisms or therapeutic targets in human diseases. In the context of COVID-19, we developed a HTRF-based assay to characterize the binding of the SARS-CoV-2 virus spike protein to the ACE2 host receptor in living cells, as well as to identify inhibitors of this interaction. In the field of Alzheimer's diseases (AD), we are currently applying new BRET, HTRF and Nluc complementation assays to unveil new molecular (and therapeutic) targets of AD-related pathological proteins: amyloid beta ($\text{A}\beta$) peptide and tau protein. This approach allowed us to reveal a negative allosteric modulator behavior of $\text{A}\beta$ on the leptin receptor, which is a main player on the regulation of metabolism and energy homeostasis. Finally, additional applications of these assays are currently being explored to better characterize the prodromal phase of AD. Financial support: France-Alzheimer Association; Philippe Chatrier Fondation; IDEX Université Paris Cité; CNRS; INSERM.

Pharmacological profiling of GPCR variants in metabolic diseases. Ralf Jockers Institut Cochin-Université Paris-Cité, CNRS, INSERM; Paris, France

G protein-coupled receptors (GPCRs) are major drug targets. Whole genome sequencing studies have revealed significant interindividual variability in the sequence of genes encoding GPCRs.

Depending on the frequency, these variants can be common or rare. Some of the variants show no apparent impact on receptor function, others modify the level of receptor expression or the functional properties of GPCRs leading to changes in the response of variant carriers to the natural ligand (hormone, neurotransmitter, etc.) or to drugs. Metabolic diseases such as type 2 diabetes and obesity are two major public health concerns with an environmental and a genetic component. Genome-wide association studies (GWAS) and exon sequencing revealed common and rare GPCR gene variants contributing to the risk of metabolic diseases. The presentation will show the path from the identification of GPCR gene variants to the multi-dimensional functional characterization of the GPCR variants to genetic association studies with metabolic traits. Examples presented include melatonin receptors and glucagon-like peptide 1 (GLP1) receptors. Based on the results new life-style and pharmacological treatment options can be proposed to variant carriers. Financial support: This work was supported by the Fondation de la Recherche Médicale (Equipe FRM DEQ20130326503), Agence Nationale de la Recherche (ANR-2011-BSV1-012-01 “MLT2D”, ANR-2011-META “MELA-BETES, ANR-21-CE18-0023 “alloGLP1R”), Institut National de la Santé et de la Recherche Médicale (INSERM), Centre National de la Recherche Scientifique (CNRS).

Investigating the Physiology of Putative Malarial 7-Transmembrane Proteins in HEK293 Cells. Maneesh K. Singh¹, Barbara Diaz¹, Maneesh K. Singh¹ Erika Cecon², Ralf Jockers² Célia R. S. Garcia¹ ¹Department of Clinical and Toxicological Analyses - School of Pharmaceutical Sciences. University of São Paulo, São Paulo, SP, 05508-090, Brazil. ²Université Paris Cité, Institut Cochin, INSERM, CNRS, F-75014, PARIS, France

Introduction: Malaria parasites cause more than 400 thousand deaths and approximately 500 million new infections yearly. Structural divergence of malarial proteins is critical to developing new antimalarials without affecting the host physiology. Despite pharmacological evidence, several canonical proteins of classical signaling pathways, including melatonin/IP3/Ca²⁺ are still not characterized because many *Plasmodium* proteins have no homology to known proteins. We have shown that melatonin and Ca²⁺ are vital for parasite asexual development¹. More importantly, melatonin binds to the 7-transmembrane (7TM) protein family comprising G protein-coupled receptors (GPCR) in vertebrates², but no such homologs have been identified in *Plasmodium* parasites. In a genome-wide search, we identified four 7-TM proteins: PfSR1, PfSR10, PfSR12 and PfSR25 in the *Plasmodium falciparum*³. However, heterotrimeric G-proteins or arrestins are still not identified in the *Plasmodium* species. We then explored the function of PfSR1 and PfSR10 in the heterologous expression systems to investigate GPCR-like physiology. We constructed several Bioluminescent Resonance Energy Transfers (BRET) based biosensors tagged to the N-terminus or C-terminus of both PfSR1 and PfSR10. Methods: Human Embryonic Kidney 293T (HEK293T) cells were cultivated in flasks with Dulbecco's Modified Eagle Media (DMEM) supplemented with 10% Fetal Bovine Serum (FBS) and 100 units/mL penicillin and 100 µg/mL streptomycin. The flasks were kept at 37°C/5% CO₂ incubator. Codon-optimized PfSR1 and PfSR10 fused to either N-ter HiBiT and SNAP or to C-ter SmBiT, HiBiT, Nluc, and YFP containing plasmids was transfected using branched polyethylenimine (PEI, Millipore-Sigma) in a proportion of 3 µg per 1 µg of DNA directly in culture media. Cells were incubated for 48 hours at 37°C before luminescence or BRET experiments were performed. Results: Direct immunofluorescent assays with the SNAP-tagged constructs indicate that both SR1 and SR10 express on the surface of parasites. Nanoluciferase complementation experiments with N-termini HiBiT tagged PfSR1 and PfSR10 show that both genes express differentially in HEK293T cells and more than 5% of total expression translocated to the cell membrane with the N-termini facing the extracellular milieu. Surprisingly, we found that SR10 facilitates the surface expression of SR1. Experiments with both N- and C-termini BRET sensors strongly indicate that PfSR10 forms a homomer. Our preliminary data show promising results in modifying secondary messengers in HEK293 cells and screening more ligands, including melatonin, are underway. Conclusion: We successfully developed several BRET-based biosensors and expressed both genes in the mammalian system. Our investigation is a step toward

unraveling the signaling mechanism mediated by SR1 and SR10. References: 1. Hotta C, Nat Cell Biol, Vol 2, 2000, 2. Cecon E, Brit J Pharmacol, 175 3263–3280, 2018, 3. Madeira L, PLoS One, Volume 3 | Issue 3 | e1889, 2008 Acknowledgments: FAPESP, CAPES, INSERM, CNRS

S3 – Novel Technologies Fostering Innovative Drug Discovery

Putting the dynamics into compound profiling: using kinetic assays to shape early stage drug Discovery. Dr Nick Holliday^{1,2} ¹Associate Professor, School of Life Sciences University of Nottingham, The Medical School QMC, Nottingham NG7 2UH ²Chief Scientific Officer, Excellerate Bioscience, Biocity, Nottingham, NG1 1GF

Drug action often occurs within a highly dynamic context *in vivo*. The concentration of the drug in the vicinity of the target continually changes based on its pharmacokinetic properties, it may be in competition for the target protein with rapidly fluctuating levels of receptor messengers or enzyme substrates, and for receptor agonists the therapeutic effect itself may depend on a particular pattern of downstream cellular signalling over time. Under such circumstances, measurement of binding rate constants defining the kinetics of drug-target interaction can be valuable in selecting desired functional properties. The benefits of optimising on and off rates during early-stage compound profiling will be briefly reviewed, including duration of action and generation of kinetic selectivity, together with emergence of non-surmountable properties for slowly reversible inhibitor and antagonist effects even in the presence of high concentrations of substrate or stimulating messenger. In practical terms, application of resonance energy transfer technologies, such as TR-FRET, in combination with fluorescent ligands is a powerful approach to generate real time assay formats to assess the kinetics of binding both for isolated recombinant proteins, and receptors in a native membrane or cellular context. Successful screening assay development for such approaches will be discussed with reference to case studies for G protein coupled receptor orthosteric and allosteric ligand binding sites, and recombinant purified enzyme targets. Finally, the extension of TR-FRET kinetic binding methodology to probe ligand behaviour at defined receptor signalling complexes will be explored. Academic funding at the University of Nottingham is acknowledged from the Medical Research Council, and studentships from the UK BBSRC, and British Pharmacological Society.

Targeting Relevant Cancer Proteins with Marine Natural Products. Leticia V. Costa-Lotufo and collaborators Departamento de Farmacologia, Instituto de Ciências Biomédicas, Universidade de São Paulo.

Target-oriented screening strategies have been gaining reputation especially in the search of new anticancer drugs, where more selective medications and new therapeutic strategies are required to improve efficacy and reduce tumor resistance. Our research group has been focused on the screening of marine natural products with anticancer potential from the Brazilian biodiversity applying a reverse affinity procedure as a tool to guide the isolation of target-specific anticancer substances. Following the identification of the hit, we use an extensive experimental approach to validate the biology of the new hit. Up to now we obtained interesting results using different targets: inhibitory apoptosis proteins (survivin and XIAP), the transcription factor TBX2, the proteasome and dermcidin. In this presentation, we will discuss examples of marine natural products that modulate these targets contributing to overcome chemoresistance in melanoma models. Financial support: FAPESP (2015/17177-6 and 2014/50926-0), CNPQ (443281/2019-0; 404518/2021-4; 440472/2022-9) and CAPES (Financial code 01).

Natural product drug discovery at LNBIO-CNPEN. Daniela B B Trivella. Brazilian Center for Research in Energy and Materials (CNPEN), Campinas-SP, Brazil

Natural products (NP) provide new chemical scaffolds for drug discovery and can probe novel enzyme binding sites and inhibition mechanisms. However, the identification of bioactive natural products and their enzyme binding mechanisms is challenging, sample and time-consuming. We have developed an integrated approach to overcome these gaps, based on high throughput screening, high throughput X-ray protein crystallography, massive mass spectrometry analyses

and customized software. This approach is named the NP³ platform. The NP³ platform starts with the HT screening of pre-fractionated NP libraries, finding bioactive NP samples, which represent mixtures of unknown natural substances. These active samples are then subjected to HT protein crystallography, aiming to capture the bioactive NPs using the crystal itself as the bait. This is done by directly soaking the bioactive NP sample into the protein crystals, following X-ray diffraction data collection, processing and extraction of the residual electron density. The latter, in turn represents the captured NP ligand revealing the active natural product binding site, its mechanism of interaction with the protein, and providing initial clues on its chemical structure. LC-MS/MS-based metabolomics is then employed for filtering candidate *m/z* (compounds) in the unknown mixture. Two software were developed for assisting in these tasks, further accelerating new discoveries from natural products: the *NP³ MS Workflow*, a software for mass spectrometry data treatment, bioactive NP ranking and chemical structure annotation; and the *NP³ Blob Label*, a deep learning application for unknown ligand segmentation to ligand building in X-ray protein crystallography. The NP³ approach proved successful even when using low resolution protein crystals and active natural products present in trace amounts in complex chemical samples. The process can be performed in miniaturized scales, in which each step is compatible with high throughput techniques. The NP³ platform is empowering natural product drug discovery, as it will be exemplified by target-based drug discovery projects currently running in our pipeline. *Serrapilheira Institute (Serra-1709-19681/Instituto Serrapilheira)*

Pre-clinical development of MB 905, an RNA polymerase inhibitor for the treatment of SARS-CoV-2. João B Calixto Center for Innovation and Preclinical Tests – Florianópolis, SC

In 2020, during the SARS-CoV-2 epidemic, the Center for Innovation and Pre-clinical Studies (CIEnP) in partnership with the Microbiológica Química Farmacêutica company and the Oswaldo Cruz Foundation - through the Center for the Development of Transmissible Diseases in Health, started the development of the research project with the objective of planning, synthesizing and developing non-clinical efficacy and safety studies of a new generation of nucleoside/tide analogues in the fight against COVID-19. Nucleoside and nucleotide analogues represent the most numerous classes of small molecules with direct-acting activity against either DNA or RNA viruses. They have high antiviral potency, selectivity, low toxicity, favourable pharmacokinetic parameters, a very high record of success in the final clinical stages and, mainly, the great potential as preventive and therapeutic agents to face acute viral infections, make this class of compounds a relevant choice for the development of a novel agents against the virus responsible for Covid-19. This project has been developed with great success and in a very short time. About 250 molecules were synthesized, most of which have already been tested in vitro against the SARS-CoV-2 virus and about 15 compounds inhibited the replication of the SARS-CoV2 virus with submicromolar concentration. Furthermore, pharmacokinetic studies showed that at least 12 of these molecules showed good oral bioavailability. One of the most promising compounds that was effective in inhibiting the replication of the Covid 19 virus in vivo - MB 905 - had its pre-clinical development carried out, demonstrating to be safe in acute in sub chronic toxicology studies and safety pharmacology studies, it has good stability in plasma and, most importantly, is capable of reaching high concentrations in the lung. It is an RNA polymerase inhibitor capable of inhibiting both in vitro and in vivo the SARS-CoV-2 virus. The National Health Surveillance Agency (ANVISA) recently approved the pre-clinical dossier for MB 905. The phase I clinical study is expected to be started soon. The Microbiological company synthesized about 12 kg of the Active Pharmaceutical Ingredient (API) with >99% purity degree and in accordance with the good manufacturing practices required by ANVISA and FDA. Research supported by MCTI/CNPq and Embrapii Part of these results were recently published in the *Nature Communications* https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9837764/pdf/41467_2023_Article_35928.pdf) and two patents were filed in the form of PCT.

S4 – Vascular Networks: The Vasculature as a Pathogenic Highway

Loss of the ROR2 Tyrosine Kinase Receptor is Associated with Dysfunctional Angiogenesis in Pulmonary Arterial Hypertension via Inappropriate Focal Adhesion Activation and Disruption of the Endothelial Barrier. Ankita Mitra, Brian Zhong, Ramesh Nair, Lyong Heo, Stuti Agarwal, Alexander Dunn, and Vinicio de Jesus Perez ¹Division of Pulmonary, Allergy, and Critical Care, ²Bioengineering, Stanford University

Rationale: Dysfunctional angiogenesis is a pathological hallmark of pulmonary arterial hypertension (PAH), but the mechanisms responsible are incompletely understood. We recently showed a vital role for the Wnt7a ligand in orchestrating angiogenesis through vascular sprouting. Wnt7a exerts its effects by interacting with ROR2, a tyrosine kinase receptor associated with Wnt pathways. We investigated how ROR2 orchestrates angiogenic responses in pulmonary microvascular endothelial cells (PMVECs) and its contribution to PAH. **Methods:** Healthy and PAH PMVECs and lung tissues were obtained from transplants and commercial sources. PMVECs were transfected with ROR2 siRNA/constructs, followed by functional and molecular studies. Focal adhesion (FA) activation and force generation was measured using FRET-based total internal reflection microscopy (TIRF). Mice with endothelial-specific conditional ROR2 KO (ROR2 ECKO) exposed to normoxia and hypoxia followed by phenotypic analysis. **Results:** ROR2 was found predominantly in the endothelium of healthy lung vessels but significantly reduced within PAH lesions. ROR2 knockdown (siROR2) reduced vascular sprouting and VEGF response comparable to PAH PMVECs. Interestingly siROR2 and ROR2-deficient PAH PMVECs also displayed increased adhesion to fibronectin and barrier permeability, which led us to check the status of focal adhesions (FA) and cell-cell junctions. Confocal and TIRF microscopy of siROR2 and ROR2-deficient PAH PMVECs revealed an increase in the FA number and force generated by individual FAs that inversely correlated with reduced VE-cadherin at cell-cell junctions. However, transfection of a ROR2 construct in PAH PMVECs resulted in the normalization of FAs activity and junctional integrity accompanied by recovery of adhesion and permeability. In animal studies, we found that, compared to controls, ROR2 ECKO developed more severe pulmonary hypertension, right ventricular remodeling, microvascular reduction, and muscularization in hypoxia, which correlated with higher levels of integrin b1 activation and reduced VE-cadherin expression. **Conclusions:** ROR2 promotes vessel sprouting and barrier formation, and its loss is associated with dysfunctional angiogenesis in PAH. Restoring ROR2 expression and/or activity could be a novel therapeutic strategy in PAH. **Funding:** NIH NHLBI

Cardiopulmonary pathogenic networks: Schisto-PAH and the lung microbiome. Suellen D. Oliveira (University of Illinois Chicago, USA)

Pulmonary arterial hypertension (PAH) is an incurable disease characterized by the hyperproliferation of vascular cells, including lung endothelial cells (ECs), which eventually form irreversible vascular lesions that collectively drive the pulmonary pressure to life-threatening levels. Although the primary cause of non-infectious PAH is not fully understood, several studies indicate it results from chronic inflammation. Curiously, infection by the intravascular parasite *Schistosoma mansoni* recapitulates key aspects of widespread inflammation that leads to PAH, providing a unique model where molecular alterations can be unraveled to develop clinical solutions for PAH. After infection, *S. mansoni* migrates through the cardiovascular system, reaching the mesenteric circulation, where the parasite lays its eggs. Within the mesentery, the eggs cross the intestinal wall, disturbing the gut microbiome or migrating to other organs, including the lungs, where they can lead to PAH. Our work is uncovering how disruption of the gutlung microbiome such as caused by *Schistosoma mansoni* infection contributes to the development of chronic inflammatory vascular diseases, including PAH.

Vascular Networks: The Vasculature as a Pathogenic Highway – the endothelial glycocalyx. Rita C. Tostes (USP-RP)

Female sex hormones exert a wide variety of effects outside the reproductive system, including the cardiovascular system and the vascular endothelium. Female sex hormones upregulate nitric oxide synthase expression and activity, decrease oxidative stress, increase vasodilation,

and protect from vascular injury. The glycocalyx is a layer composed of carbohydrate side chains bound to core proteins that lines the vascular endothelium. The integrity of the glycocalyx is essential for endothelial cells' performance and vascular homeostasis. The neuroendocrine and immune systems influence the composition, maintenance, activity and degradation of the endothelial glycocalyx. We will discuss how female hormones modulate the endothelial glycocalyx, initially showing the impact of COVID-19 on the glycocalyx and then looking at the effects of sex hormones on this endothelial structure. Diseases prevalent in women that alter the glycocalyx, and therapeutic forms to prevent glycocalyx degradation and potential treatments that can reconstitute its structure and function will also be mentioned.

S5 – Metabolic Host-Microbiome Interactions in the Context of Drug, Pharmacokinetics, and Toxicology Metabolism

Identifying microbiome contributions to drug metabolism and toxicity. Michael Zimmerman (European Molecular Biology Laboratory, Heidelberg, Germany)

Individuals vary widely in their drug responses, which can be dangerous and expensive due to significant treatment delays and adverse effects. Growing evidence implicates the gut microbiome in this variability; however the molecular mechanisms remain mostly unknown. Using antiviral nucleoside analogues and clonazepam as examples, we recently reported experimental and computational approaches to separate host and gut microbiota contributions to drug metabolism. The resulting pharmacokinetic models identified measurable physiological, microbial and chemical parameters that dictate host and microbiome contributions to the metabolism of xenobiotics. To systematically map the drug metabolizing capacity of the gut microbiota and assess its potential contribution to drug metabolism, we further measured the ability of >130 diverse human gut bacteria and gut microbial communities to metabolize each of 271 oral drugs. We found that two thirds of these drugs are chemically modified by at least one of the tested microbes. Through combination of high-throughput bacterial genetics with mass spectrometry, we systematically identified drug-metabolizing microbial enzymes. These proteins better explain the drug-metabolizing capacity of bacterial strains than their phylogenetic classification. We further demonstrate that the abundance of homologs of these proteins predict the capacity of complete human gut communities to metabolize the targeted drugs. These causal links between microbiota gene content and metabolic activities connect inter-individual microbiome variability to interpersonal differences in drug metabolism, which has translatable potential on medical therapy and drug development across multiple disease indications.

Deconvoluting host-gut microbiota interactions at the single cell level. Vinícius Dias Nirello¹, Nathália Vitoria Pereira Araújo¹, Mariane Font Fernandes², Marco Aurélio Ramirez Vinolo^{2,3,4} and Patrick Varga-Weisz^{1,5,6} ¹International Laboratory for Microbiome Host Epigenetics, Department of Genetics, Evolution, Microbiology, and Immunology, Institute of Biology, University of Campinas, Campinas, SP Brazil ²Laboratory of Immunoinflammation, Department of Genetics and Evolution, Microbiology and Immunology, Institute of Biology, University of Campinas, Campinas, SP Brazil ³Obesity and Comorbidities Research Center (OCRC), University of Campinas, Campinas, SP Brazil. ⁴Experimental Medicine Research Cluster, Campinas, SP, Brazil. ⁵São Paulo Excellence Chair, Department of Genetics, Evolution, Microbiology, and Immunology, Institute of Biology, University of Campinas, Campinas, SP, Brazil ⁶School of Biological Sciences, University of Essex, Colchester, UK

The gut microbiome constitutes a dynamic quasi-organ that affects physiology in health and disease profoundly. It does so by generating bioactive molecules that are taken up by the host and affect the body systemically. Previously we have described how a fiber-rich diet affects the structure and function of the colon epithelium via the microbiota and specific immune cells, especially $\gamma\delta$ T cells (Corrêa et al. Microbiome 2023). Here we employed single cell transcriptome and chromatin analysis in conjunction with microbiome-depletion to reveal the dynamic and cell-type specific responses on microbiota-depletion that affect both of the

colon epithelium. Our work illustrates how the microbiota shape gross- and microanatomy of the colon epithelium. Intestinal Dysbiosis is Crucial for the Exacerbation of Adrenal Glucocorticoid Steroidogenesis in Diabetic Mice. Vinicius de Frias Carvalho Research at Laboratory of Inflammation of Oswaldo Cruz Institute/ Fiocruz

Introduction: Prior investigation shows hyperactivity of the hypothalamus-pituitary-adrenal axis, in diabetic patients, which was related to some comorbidities noted in those patients, including wound-healing deficiency, neuropathy, and high risk of depression and Alzheimer's disease development. It is well known that diabetic patients showed gut dysbiosis and translocation of pathogenic bacteria to the bloodstream. This study investigates the role of gut dysbiosis on the exacerbation of adrenal glucocorticoid steroidogenesis in diabetic mice. Methods: Diabetes was induced by intravenous injection of alloxan into fasted male Swiss-webster, C3H.He, and C3H.HeJ (TLR4 mutant) mice. Antibiotic therapy (ampicillin, metronidazole, and neomycin) or TLR4 antagonist (TAK-242) were administered daily for 14 consecutive days, starting 7 days post diabetes induction. All the analyses were performed 21 days after diabetes induction. Results: We showed that diabetes-induced an increase in the expression of ACTH receptor MC2R and steroidogenic enzymes StAR and 11 β HSD1, besides a rise in the content of TLR4 and TRIF in the adrenal gland, in parallel to hypercortisolism in both Swiss-webster and C3H.He mice. In addition, diabetic mice modified the relative abundances of opportunistic pathogenic bacteria in association with an increase in the inflammatory score and pro-inflammatory cytokines, including IL-17, IL-22, and TNF- α , in the colon of Swiss-webster mice. Diabetes also increased the permeability of the epithelial-intestinal barrier, attested by a high translocation of FITC dextran from the gastrointestinal tract to the bloodstream, in parallel to overexpression of LPS in the adrenal glands of Swiss-webster mice. The antibiotic therapy decreased the expression of steroid machinery, TLR4, and TRIF overexpression in the adrenal glands of diabetic mice in parallel to a reduction in hypercortisolism. Finally, treatment with TAK-242 reduced the hypercortisolism of diabetic mice, as well as C3H.HeJ after diabetes induction. Conclusion: Our results showed that activation of the LPS-TLR4-TRIF pathway, because of gut dysbiosis, is involved in the hypercortisolism observed in diabetic mice. S6 – Nanotechnology and its Application in Pharmacotherapy

Nanotechnology applied in the treatment of inflammatory bowel disease. Sandra H.P. Farsky Faculty of Pharmaceutical Sciences University of São Paulo

Inflammatory bowel diseases (IBDs) disrupt the intestinal epithelium, leading to severe chronic morbidity. Current therapies cause adverse effects, are expensive and patients can be unresponsive. Hence, the research to find out novel targets and drugs are imminent in IBDs. Our and others research groups have shown the pivotal role of the protein Annexin A1 (AnxA1) on control of IBDs. Hence, we have developed nanotechnologies to deliver AnxA1 or its related peptide Ac2-26 aiming to treat IBD by oral route. In collaboration with Drs. Adriana Polhmann and Silvia Guterres, Federal University of Rio Grande do Sul, we functionalized recombinant AnxA1 on multi-wall lipid core nanocapsules (MLNC; covered with chitosan and functionalized with Zn²⁺), which was more efficient than AnxA1 to treat dextran sulfate sodium (DSS)-induced colitis in C57BL/6 mice by i.p. route. More recently, in collaboration with research groups coordinated by Dr. Marcia Fantini, Physics Institute, University of Sao Paulo, and Dr. Marco A. Stephano, Faculty of Pharmaceutical Sciences, University of São Paulo, we developed a nanostructured mesoporous microparticle (SBA-15) system loading Ac2-26. SBA-15 is high

thermic, hydrothermal and mechanic resistant material, conferring its ability to resist pH and enzymatic actions. SBA-15-Ac2-26 was covered with Eudagrit[®], a pH-responsive anionic copolymer to protect the formulation from the unwanted harms of the gastrointestinal medium. This formulation was efficient to treat DSS-induced colitis in mice by oral route, unveiling a simple and cheap microparticle to deliver the Ac2-26 into inflamed gut by oral route. Financial Support: Fapesp Grants 2017/17844-8, 2019/07007-7, 2022/11602-0; Marcia Fantini, Adriana Polhman, Sandra Farsky are CNPq Research Fellows.

Gold nanoparticles-based therapy for chronic lung inflammatory diseases. Patrícia Machado Rodrigues e Silva – Laboratory of Inflammation – Oswaldo Cruz Institute/FIOCRUZ, Rio de Janeiro - RJ, Brazil.

Chronic lung disorders are an important aspect of clinical medicine, affecting millions of people globally, being one leading cause of death and disability worldwide. Despite the recognized advances in the currently available therapy, there are still diseases refractory to standard treatments, such as pneumoconiosis. Evidence exists that gold nanoparticles (AuNPs) have a marked anti-inflammatory activity, turning them into a potential therapeutic option. Testing the effect of aerosolized AuNPs on the late phase of experimental silicosis in mice, we showed the inhibition of lung function decrease and airways hyper-reactivity. Alterations in the lung tissue morphology were noted under the condition of AuNP therapy, including changes in the granuloma pattern (disruption and disorganization) and adjacent mononuclear cells and granulocytes being detected. An enlargement of the alveolar spaces and the presence of cellular plugs inside the bronchioles were also detected, supporting the idea that AuNPs improve functionality and the clearance of inflammatory cells in the silicotic lungs. Inhibition by AuNPs of lung inflammation and fibrosis lasted at least 15 days after the last aerosolization. By transmission electron microscopy, osmiophilic black particles were noted in the lungs. No changes in body weight as well as in cellular and biochemical blood parameters were detected after AuNPs, including the absence of liver and kidney toxicity. Negligible amounts of AuNPs were detected in the other tissues. Collectively, our findings show that therapeutic treatment with AuNPs can reverse important pathological features triggered by inhalation of silica particles, including restoration of lung function, thus suggesting that AuNPs might be a promising strategy as an innovative anti-fibrotic approach for the treatment of silicosis. Financial support: FIOCRUZ, FAPERJ, CNPQ and CAPES.

S7 – Advances in Cancer Research and Therapeutics: Exploiting the Tumor Microenvironment and Chemistry-based Drug Delivery

Mature Tertiary Lymphoid Structures are Key Niches of Tumor-Specific Immune Responses in Pancreatic Ductal Adenocarcinomas. Gabriela Sarti Kinker¹, Glauco Freire Vitiello¹, Ariane Barros Diniz², Mariela Cabral-Piccin¹, Pedro Henrique Pereira¹, Maria Letícia Rodrigues Carvalho¹, Wallax Silva Ferreira¹, Alexandre Silva Chaves¹, Amanda Rondinelli¹, Arianne Fagotti Gusmão¹, Alexandre Defelicibus¹, Gabriel Oliveira dos Santos¹, Warley Abreu Nunes¹, Laura López Claro^{1,3}, Talita Bernardo³, Ricardo Nishio³, Adhemar Pacheco³, Ana Carolina Laus³, Lidia Rebolho Arantes³, Julia Fleck⁵, Victor Hugo de Jesus¹, André de Moricz³, Ricardo Weinlich², Felipe Fernandez Coimbra¹, Vladimir Cordeiro de Lima¹, Tiago da Silva Medina¹. ¹A. C. Camargo Cancer Center, Brazil. ²Hospital Israelita Albert Einstein, Brazil. ³Santa Casa de Misericórdia do Estado de São Paulo, Brazil. ³Barretos Cancer Hospital, Brazil. ⁵Mines Saint-Etienne, Univ Clermont Auvergne, France.

Pancreatic ductal adenocarcinoma (PDAC) is a lethal disease that remains refractory to most currently available treatment modalities, including immunotherapy. As a deeper understanding of the PDAC immune microenvironment is needed to identify novel therapeutic targets and predictive biomarkers, here we explored the relevance of lymphocyte compartmentalization into tertiary lymphoid structures (TLSs) for the generation of local antitumor immunity. We found that a subset of PDAC patients harbors fully developed TLSs where B cells proliferate, undergo antibody affinity maturation, and differentiate. Importantly, these mature TLSs also support T

cell activity and are enriched with tumor-reactive T cells that may act as TLS organizers by producing the B cell chemoattractant CXCL13. We also showed that chronically activated, tumor-reactive T cells exposed to fibroblast-derived TGF- β may act as TLS organizers by producing the B cell chemoattractant CXCL13. Finally, we showed that the expression of a gene signature reflecting mature TLSs was enriched in pre-treatment tumors from metastatic PDAC patients with longer overall survival after receiving different chemoimmunotherapy regimens. Altogether, we provided a framework for understanding the biological role of PDAC-associated TLSs and revealed their potential to guide the selection of patients for future PDAC chemoimmunotherapy trials. Financial support: FAPESP (#2018/14034-8)

Uncovering Novel Macrophage Subsets in Cancer Using Single-Cell RNA Sequencing and Spatial Localization. Rodrigo Nalio Ramos (HC-FM-USP-SP and InCOR-SP)

Macrophage infiltration is a hallmark of solid cancers, and overall macrophage infiltration correlates with lower patient survival and resistance to therapy for distinct tumor types. Tumor-associated macrophages (TAMs), however, are phenotypically and functionally heterogeneous and might be endowed with distinct roles on cancer progression and antitumor immunity. Using single-cell RNA-sequencing and multispectral immunofluorescence we characterized two distinct macrophage subpopulations in healthy mammary gland and breast cancer primary tumors. We revealed a discrete population of FOLR2+ tissue-resident macrophages (TRM) that localize in perivascular areas in the tumor stroma from distinct tumor types, where they interact with CD8+ T cells. In addition, we found an abundant TREM2+ TAMs accumulated at the invasive margin and tumor nest. FOLR2+ macrophages efficiently stimulate effector CD8+ T cells *ex vivo*, while TREM2+ TAMs have inferior capacity to stimulate polyfunctional T lymphocytes. Importantly, FOLR2+ TRM positively correlates with better patient survival and with important anti-tumoral immune players such as NK cells, cytotoxic CD8+ T cells and tertiary lymphoid structures. Our study highlights specific roles for tumor-associated macrophage subsets and paves the way for subset-targeted therapeutic interventions in macrophages-based cancer therapies.

Bioorthogonal Chemistry-Based Drug Delivery for Precision Cancer Treatment. *Prof. Dr. Josiel Barbosa Domingos Laboratory of Biomimetic Catalysis (LaCBio), Department of Chemistry, Universidade Federal de Santa Catarina, Florianópolis, Brazil*

Bioorthogonal chemistry is a rapidly evolving field that offers exciting possibilities for developing targeted drug delivery methods for cancer treatment. Transition metal-catalyzed reactions, such as palladium-mediated decaging reactions, have emerged as a powerful tool for the activation of exogenous substrates within living systems, enabling precise and efficient drug delivery to cancer cells. In this lecture, the latest research from the LaCBio research group will be presented, highlighting our efforts in developing innovative strategies for bioorthogonal drug delivery using palladium-promoted decaging reactions under biological conditions. By harnessing the unique catalytic properties of transition metals, this approach has the potential to overcome many of the limitations associated with traditional drug delivery methods, providing a promising avenue for precision cancer treatment.

Financial support: CNPq and CAPES.

S8 – Digestive Diseases and Glycoscience: Innovation Opportunities Beyond Mere Topical Protective Materials

Biopolymers as promising molecules for the treatment of upper GI diseases: mechanistic insights and therapeutic status. Lucas Antonio Duarte Nicolau (UFDFPar)

Gastroesophageal reflux disease (GERD) is one of the most common gastrointestinal disorders, in which the stomach contents called refluxate, move up into the oesophagus. Refluxate is composed by acid, pepsin, bile acids and other noxious material achieve the oesophageal mucosa and interact with the luminal components of the pre-epithelial line. The earliest protective shield to these potentially injurious elements is a distinct mucus layer that coats the mucosa, which is composed of highly glycosylated proteins called mucins that provide

lubrication for the alimentary passage, participating in cell signaling routes and protecting the host epithelium from harmful contents as refluxate in GERD patients. The oesophagus displays secreted and transmembrane mucins in healthy people, whilst oesophageal levels of mucins are considerably augmented in response to refluxate contents. Typical symptoms include mainly heartburn and acid regurgitation. Current guidelines indicate that patients should first try a standard therapy based on acid suppression with proton pump inhibitor (PPI), but it partially fails in all phenotypes of GERD. Topical protectant solutions associated to PPIs are linked with better outcomes in GERD patients due to their ability of preserving pre-epithelial barrier including mucin patterns. Our research group studied commercial alginates, natural gums (from *Anacardium occidentale* and *Anadenanthera colubrina*), and algae biopolymer (from *Gracilaria caudata*), which demonstrated important muco-adhesiveness with clinical relevance since the mechanism of action up to now consist of improve transepithelial electrical resistance and decrease mucosal permeability in human biopsies of oesophageal mucosa and on experimental GERD in rodent models due to the interaction with mucosal barrier as demonstrated with fluorescent microscopy. Therefore, anti-inflammatory profile of topical materials with muco-adhesive action may be attributed not to a mere physical barrier, but by avoiding cell signaling downstream of inflammation pathways. Glycobiology of biopolymers-oesophageal mucus layer opens avenues to explore promising candidates for clinical GERD management. Financial support: CAPES, CNPq, FUNCAP and FAPEPI.

Biological functions, the possible mechanism of action, and application of naturally occurring polysaccharides to medical science. Daniele Maria-Ferreira Faculdades Pequeno Príncipe, Curitiba, Brazil.

Instituto de Pesquisa Pelé Pequeno Príncipe, Curitiba, Brazil.

Inflammatory bowel disease, oral and intestinal mucositis are life-threatening problems in which conventional treatment is associated with significant side effects. In addition, treatment alternatives are not curative, and many patients do not respond to available options. Given these considerations, recent advances in glycoscience and glycotechnology have created unique opportunities to advance scientific knowledge in pharmacology. The discoveries enable the identification of a broad range of biological processes and their importance to human health. For example, natural polysaccharides can protect gastrointestinal mucosa, regulate inflammatory processes, alter the diversity of the microbiota, and influence the production of intestinal metabolites, and have been investigated as molecules of interest for the development of novel therapeutics to treat numerous diseases and conditions, including those of the gastrointestinal tract. In light of the above considerations, this presentation will discuss the biological effects and possible mechanisms of action of polysaccharides from natural sources in diseases and conditions of the gastrointestinal tract, particularly ulcerative colitis, oral and intestinal mucositis induced by cancer therapy. Recent advances in polysaccharide therapy will also be discussed. Integrating knowledge of the importance of polysaccharides with biotechnology and innovation may provide the basis for future investigations and offer new perspectives for translational pharmacology. This work was supported by the Instituto de Pesquisa Pelé Pequeno Príncipe (Brazil) and Conselho Nacional de Desenvolvimento Científico e Tecnológico (CNPq, Bolsista Produtividade do CNPq – Brasil).

S9 – Cannabinoid Therapy: from Bench to Bedside

How to Protect the Brain Against Neurotoxic Events with Cannabinoid Therapy? Donato, MF Laboratory of Medical Cannabis and Psychedelic Science, Federal University of Latin American Integration (UNILA). Foz do Iguaçu, PR. Brazilian Society for the Study of Cannabis sativa – SBEC. Brazil.

The Endocannabinoid System (ECS) is a regulating system that maintains the body's internal balance, the central nervous system functions, and other physiological systems such as the immune, reproductive, cardiovascular, and respiratory systems. The main components of the ECS are the cannabinoid receptors CB1 and CB2, the endocannabinoids (eCB) anandamide

(AEA) and 2-arachidonoylglycerol (2-AG), the endocannabinoid anabolic and catabolic enzymes and the AEA transporter. This system works like an authentic orchestra in regulating neurotransmission, inhibiting or stimulating the release of neurotransmitters, especially L-glutamate (L-glu) and gammaaminobutyric acid. ECS is involved in physiological events such as neuroplasticity, sleep, memory, appetite, body temperature, and immune response, among others, so the imbalance in the production of eCBs or the expression of the receptors is related to pathological conditions ranging from pain and chronic inflammation, memory loss, psychiatric and metabolic disorders, epileptic conditions that in most cases result from neurotoxicity or inflammation processes. In this sense, the failure in glutamatergic neurotransmission is the primary pathological mechanism of different neurological disorders due to excitotoxicity processes. Therefore, a rescue in the functioning of the ECS or replacement of cannabinoids can treat or prevent several pathologies. In this perspective, the phytocannabinoids isolated from *Cannabis sativa* L., delta9tetrahydrocannabinol (THC) with neuroprotective, analgesic, muscle relaxing, antiemetic properties, and cannabidiol (CBD) with anti-inflammatory, neuroprotective, anxiolytic, antioxidant, antipsychotic, anticonvulsant properties can act with great therapeutic prospect in pathologies refractory to conventional treatment. The interaction of THC and CBD added to the effects of other metabolites of the *Cannabis* is responsible for the entourage effect, enhancing the benefits of cannabinoid therapy. However, the golden key is to find the correct dose to adjust these cannabinoids in controlling neurotoxic events. Financial support: CNPq

Endocannabinoid system and cannabis-derivative products: Perspectives for cannabis treatment in autism. Luzia da Silva Sampaio Laboratório de Neuroquímica, Instituto de Biofísica Carlos Chagas Filho - Universidade Federal do Rio de Janeiro

The endocannabinoid system (ECS) is composed of endogenous cannabinoids (eCB), cannabinoid receptors (CBR) and enzymes responsible for the biosynthesis of these agonists. The ECS is found in all cells and tissues, where it plays the role of homeostatic control, modulating physiological functions. In the Central Nervous System, these compounds are distributed in neural cell, such as neurons and glia, impacting neurotransmission in the neuron-neuron, glia-glia and neuroglial communication, synthesis and release of neurotransmitters and glial factors, and cellular metabolism. The Autism Spectrum Disorder (ASD) is a multifactorial neurological disorder that comprehends social and behavioural impairment with no effective treatment available, even though it severely affects children, possibly to the poorly described neurobiological basis of ASD. Animal models of ASD have shown a correlation between the symptoms reported and unbalanced homeostasis in systems modulated by ECS, such as alterations in excitatory and inhibitory neurotransmission system, unpaired neuroglial interaction, reactive gliosis and metabolic damage in glial cells. Clinical studies reported that ASD patients have lower plasma levels of anandamide (AEA), suggesting hypoactivity of ECS. Recently, increasing use of CBD-rich full-spectrum Cannabis extracts have been observed and positive effects reported, constituting a promising alternative to ASD treatment, despite few studies describing the pharmacological properties of these products. This presentation aims to discuss the correlation between ECS alterations to ASD physiopathology and the perspectives in Cannabis treatment in ASD and describe the pharmacological basis of CBD-rich full-spectrum Cannabis extracts. Financial support: FAPERJ, CAPES

S10 – Potential Targets and Innovative Therapies for Parkinson's Disease

The Clinical Importance of Levodopa-Induced Dyskinesias (DIL) and its Mechanisms. Vitor Tumas Universidade de São Paulo, Faculdade de Medicina de Ribeirão Preto.

We will present here a brief historical review of the observation and clinical relevance of DIL, and its context in the current treatment of patients with Parkinson's disease (PD). We will discuss the main pathophysiological mechanisms involved with the phenomenon, and we will describe the studies we carried out in experimental and clinical models that pointed to the participation of nitric oxide and neuroinflammation among the mechanisms involved with DIL.

Targeting microRNAs to inhibit underlying mechanisms of Parkinson's disease. Ricardo Titze de Almeida (Research Center for Major Themes – University of Brasília)

In this summary, we present the involvement of microRNAs (miRNAs) in Parkinson's disease (PD), and their potential as therapeutic targets. MiRNAs are small, double-stranded RNA molecules that play a crucial role in regulating cellular transcriptomes by specifically interacting with mRNA molecules through RNAi mechanisms. Dysregulated miRNAs have been implicated in multiple disorders, including PD, which is the second most prevalent neurodegenerative disease globally. Recent advances in nanotechnology and oligonucleotide chemistry have paved the way for developing RNAi therapeutics using miRNA mimics and AntimiRs. These innovative strategies aim to enhance the stability of RNA molecules and boost transfection efficiency by using synthetic particles. Nevertheless, addressing targeted delivery, minimizing toxicity, and optimizing costs remain as challenges before these therapeutics can reach their full potential. One major obstacle in treating brain diseases with small RNA molecules involves overcoming the blood-brain barrier. Stereotaxic surgery, despite being an invasive procedure requiring hospitalization, presents a viable solution. This technique facilitates tissue-specific delivery, reducing treatment costs and mitigating off-target effects in other tissues. Furthermore, since miRNAs modulate multiple mRNA targets, their application could potentially target various underlying mechanisms of PD. In conclusion, miRNAs represent promising drug targets for altering the progressive nature of PD.

S11 – Cardio Steroids and α -Na,K-ATPase Isoforms in Neurological Disorders: New Insights

Role of endogenous ouabain and Na,K-ATPase α -isoforms in the etiology of bipolar disorder.

Rif S. El-Mallakh Mood Disorders Research Program, Depression Center, Department of Psychiatry and Behavioral Sciences, University of Louisville School of Medicine, 401 East Chestnut Street, Suite 610, Louisville, KY 40202 USA

Background: Bipolar disorder is a severe psychiatric illness with poor prognosis and problematic and suboptimal treatments. Understanding the pathoetiologic mechanisms may improve treatment and outcomes. Discussion: Dysregulation of cationic homeostasis is the most reproducible aspect of bipolar pathophysiology. Correction of ionic balance is the universal mechanism of action of all mood stabilizing medications. Recent discoveries of the role of endogenous sodium pump modulators (which include 'endogenous ouabain') in regulation of sodium and potassium distribution, inflammation, and activation of key cellular second messenger systems that are important in cell survival, and the demonstration that these stress-responsive chemicals may be dysregulated in bipolar patients, suggest that these compounds may be candidates for the coupling of environmental stressors and illness onset. Specifically, individuals with bipolar disorder appear to be unable to upregulate endogenous ouabain under conditions that require it, and therefore may experience a relative deficiency of this important regulatory hormone. In the absence of elevated endogenous ouabain, neurons are unable to maintain their normal resting potential, become relatively depolarized, and are then susceptible to inappropriate activation. Furthermore, sodium pump activity appears to be necessary to prevent inflammatory signals within the central nervous system. Nearly all available data currently support this model, but additional studies are required to solidify the role of this system. Conclusion: Endogenous ouabain dysregulation appears to be a reasonable candidate for understanding the pathophysiology of bipolar disorder.

Testing Endogenous Ouabain Inhibitors in the Myshkin Mouse Model of Alternating Hemiplegia of Childhood (AHC). Steven J. Clapcote, School of Biomedical Sciences, University of Leeds, Leeds, LS6 3BX, UK

Heterozygous missense mutations in *ATP1A3*, encoding NKA $\alpha 3$, are the primary cause of alternating hemiplegia of childhood (AHC), a rare neurodevelopmental disorder that manifests as episodic hemiplegia starting in the first 18 months of life. The current primary treatment for AHC, the Ca^{2+} channel blocker flunarizine, can reduce the severity, duration or frequency of hemiplegic episodes, but is ineffective in some patients. The *Myshkin* mouse model

(*Atp1a3*^{Myk}) harbours mutation I810N in *Atp1a3* exon 18. The I810N mutation has been observed in three AHC patients, including one with comorbid autism spectrum disorder, all of whom presented with typical AHC symptoms and epilepsy. Adult heterozygous *Myshkin* (*Myk/+*) mice have a 42% reduction in NKA activity in the brain and a 16-18% reduction in body weight compared with WT mice. *Myk/+* mice exhibit an elevated metabolic rate, visible whole-body tremors, a broad-based gait, and episodes of hemiplegia. Endogenous inhibitors of the NKA, identified as normal constituents of mammalian tissue, are collectively termed endogenous cardiotoxic steroids (ECS). The best studied ECS is endogenous ouabain (EO), which is synthesised in and released from the adrenal gland and hypothalamus of mammals. Unlike in humans, where all four α isoforms are ouabain-sensitive, the $\alpha 1$ isoform of mice and rats has substitutions (Q118R and N129D) that confer resistance to ouabain. Reduced activity of NKA $\alpha 3$, due to heterozygous loss-of-function mutations in *ATP1A3*, is widely considered the underlying mechanism of AHC. Therefore, interventions that will increase NKA $\alpha 3$ enzymatic activity may improve the clinical symptoms. Since the activity of NKA $\alpha 3$ is determined, among other factors, by ECS, we hypothesise that antagonising the effects of these endogenous NKA inhibitors may be beneficial. To establish proof-of-concept for this approach using the *Myshkin* mouse model, we are quantifying the effects of different antagonists of endogenous NKA inhibitors – three small molecules (BD-15, rostafuroxin and compound 16) and one antibody (DigiFab) – on the behaviour and brain NKA activity of *Myk/+* mice. Grant support: Hope for Annabel

Dental Pulp-Derived Mesenchymal Stem Cells for Modeling Neurogenetic Disorders Associated with Na⁺,K⁺-ATPase.

Leite JA^{1,2} ¹Department of Pharmacology, ICB-UFG, Goiânia, Brazil. ²Laboratory of Education and Research In Vitro Toxicology, Tox In, FF-UFG, Goiânia, Brazil.

Introduction: Alternating hemiplegia of childhood (AHC) is a rare disease characterized by episodes of hemiplegia on any side of the body and paroxysmal events. The etiology of the disease due to *ATP1A3* gene mutations, which encodes the $\alpha 3$ -Na⁺,K⁺-ATPase (NKA) isoform. Dental pulp stem cells (DPSC) are an important source of stem cells capable of self-renewal and multi-lineage differentiation and are an interesting tool for developing microtissues for applied research in the context of the emerging field of microphysiological systems (MPS). This study aimed to evaluate the potential of human DPSC to be used to model neurogenetic disorders associated with the $\alpha 3$ -NKA. Methods: DPSC were isolated from deciduous teeth from volunteers' control or AHC patient, cultured and characterized by expression of CD90, CD105, Stro-1, Nanog, OCT-3/4, CD34 and CD45 by flow cytometry, and $\alpha 1$ and $\alpha 3$ -NKA by immunofluorescence. Additionally, to differentiate DPSC into neural progenitor cells (NPC), 1x10⁶ cells were cultured with DMEM/F12 added with B27, EGF, bFGF and penicillin/streptomycin. NPCs were characterized by expression of Nestin, GFAP, CD90, Ki67, $\alpha 1$ and $\alpha 3$ -NKA by immunofluorescence. Then, NPCs were placed into MPS and viability was assessed. Ethical protocol: #44067021.0.0000.5083. Results: DPSC were positive for CD90, CD105, Stro-1, Nanog, Oct 3/4, Nestin and $\alpha 1$ -NKA, low for CD34 and CD45, and negative for $\alpha 3$ -NKA, no differences between the studied groups. Moreover, DPSC from control and AHC differentiated into NPC and revealed positive expression of Nestin, GFAP, Ki67, $\alpha 1$ and $\alpha 3$ -NKA, and negative CD90. No differences between the control and AHC groups. Additionally, NPC from control and AHC patients remained viable into MPS for up to 6 hours. Conclusion: Our data support the potential use of DPSC for the development of neural human microtissues to be used for modeling neurogenetic disorders associated with $\alpha 3$ -NKA and development of drugs for the treatment of AHC, ensuring better quality of life for patients affected by this rare disease, which still lacks pharmacological treatment. Financial Support: CNPq.

New Pharmacological Therapy for Childhood Alternating Hemiplegia (AHC): Evaluation of BD-15 and Development of New Drugs. Leandro A Barbosa. Universidade Federal de São João del-Rei, Campus Centro-Oeste Dona Lindú, Divinópolis, MG

Digoxin and other cardiotonic steroids (CTS) exert their effect by inhibiting Na,K-ATPase (NKA) activity. CTS bind to the various NKA isoforms expressed in different cell types, giving CTS its narrow therapeutic index. We have synthesized a series of digoxin derivatives (γ -Benzylidene digoxin derivatives) with substitutions in the lactone ring (including non-oxygen and ether groups), to obtain CTS with better NKA isoform specificity. Some of these derivatives show some NKA isoform selective effects. One of particular interest is BD-15, which demonstrated in SF9 cells expressed the α 1-3 isoforms, BD-15 was able to increase specific α 3 activity of NKA. A molecular docking approach favored NKA isoform-specific interactions for the compounds that supported their observed activity. Moreover, BD-15 was tested in Wistar rats for 3 days in IP treatment in 20, 100, and 200 μ g/Kg concentrations and BD-15 did not alter the behavior of rats treated with different doses. An increase in the specific α 2,3-Na,K-ATPase activity was again observed for all doses of BD-15 tested in the hippocampus and prefrontal cortex. Subsequently, when the effect of BD-15 on cardiac tissue was analyzed, we did not find any signal of cardiotoxicity and cell death. The cell cytotoxicity was tested on cancer cell lines and BD-15 exhibited low cytotoxicity in tumor and non-tumor cells, presenting IC50 values of 8 μ M, while digoxin showed cytotoxicity at nanomolar concentrations. Another important effect of BD-15 is the neuroprotection effect found in the chemical ischemia model in N2a cells and in a global ischemia model in Wistar rats, where BD-15 significantly prevented cell death caused by ischemia. BD-15 can be a promising drug for AHC treatment since it increases the activity of the α 3-Na,K-ATPase in the hippocampus and prefrontal cortex has a neuroprotection effect, and decreases oxidative stress in these brain regions. Career Opportunities in Forensic Sciences in Brazil. Heitor S. D. Correa. *Forensic DNA Laboratory, Politec/MT, Cuiabá, Brazil

Forensic science can be defined as the use of scientific methods or expertise to investigate crimes or examine evidence that might be presented in a court of law. It is a field that is usually associated with criminal investigation, but that, in reality, goes far beyond law enforcement. The field of forensics has experienced an increasing amount of interest from the general public, with the help of tv shows, movies, social media and podcasts. Therefore, it is overdue that people comprehend the diverse subfields within forensic science, and disseminate that knowledge. In Brazil, forensics is very restricted to the governmental sector, with little private sector input, compared to other countries. Nevertheless, there is a wide array of career opportunities in forensics that encompass even the third sector, in non-profit, humanitarian and supranational organizations. Currently, it is necessary that entrepreneurs see the potential of this field and invest in it, so that it can further develop. Also, forensics has job opportunities for a wide range of self-employed professionals. But it is necessary that they advertise and educate prospective clients on the importance of their role in order to thrive.

I Finished My PhD... What's Next? How My Academic Experience is Essential for Nonclinical Research in the Pharmaceutical Industry (*Terminei o doutorado... e agora? Como a minha experiência acadêmica é essencial para a pesquisa não-clínica na indústria farmacêutica*)
Juliana Montenegro Parente, Aché Laboratórios Farmacêuticos

The COVID-19 pandemic changed our lives. For researchers who, like me, were finishing their PhDs by this time, these changes were even harder. Many of us thought: "what should I do next?". The answer to this question wasn't easy to find. When the world most needed scientists, Brazilian scientists like myself were actually concerned about their futures. I felt such concern deeply. I learned from it, and I hope I can now share my experience to inspire others into pursuing new opportunities. I finished my PhD in Pharmacology (FMRP/USP) in 2021 and I currently work as research and development analyst at a national pharmaceutical industry. My job is to assist the company finding new therapeutical targets and developing new drugs for such targets. My team manages research projects from their discovery phase until the early

development stage, which comes before clinical trials. We analyze the nonclinical efficacy and safety of the new drugs prototypes and prepare them to be produced in industrial scale. Nonclinical research is a field in the pharmaceutical industries where PhD and/or MSc degree holders are needed. Our experience with research, project management and scientific knowledge is very appreciated and necessary. My presentation will show not only that there are opportunities to work with scientific research beyond academia, but also how you can reach such opportunities as a researcher.
